

Prospective Risk Adjustment

EVE™ Hybrid AI

EVE Hybrid AI modernizes how organizations identify diagnosis opportunities for clinical review and validation. By combining agentic evidence extraction with deterministic clinical formulas, EVE delivers provable, explainable, audit-ready suspects that reduce provider abrasion and improve outcomes.

One patient. One evidence graph. Infinite applications.

The problem

Providers face a significant time burden when reviewing prospective suspects. Legacy NLP systems surface noisy, irrelevant, or non-actionable suspects that demand manual sorting through low-quality findings. Without clear evidence or transparent reasoning, providers experience audit anxiety and have to rework their own chart reviews.

When it comes to prospective risk adjustment, providers are dealing with:

- Too many false positives, slowing clinical decision-making
- Lack of evidence traceability, creating audit risk
- Inflexible systems that require months to adapt to regulatory changes
- Workflow interruptions that reduce focus on care

How EVE changes the equation

Providers face a significant time burden when reviewing prospective suspects. Legacy NLP systems surface noisy, irrelevant, or non-actionable suspects that demand manual sorting through low-quality findings. Without clear evidence or transparent reasoning, providers experience audit anxiety and have to rework their own chart reviews.

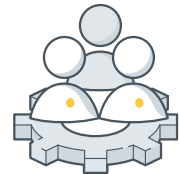

Provable and explainable results

With EVE, every suspect pairs directly to chart evidence and clinical reasoning. Deterministic formulas ensure suspects are traceable, audit-ready, and fully supported by direct-source documentation. Providers gain confidence in recommendations and make faster decisions without rework.

Benefit: Audit-ready output with zero post-hoc justification needed.

Reduced provider abrasion

EVE delivers up to 3 times less noise than legacy natural language processing (NLP) systems. Providers and coders navigate fewer irrelevant findings and can focus their time on high-value clinical review instead of sorting through false positives.

Benefit: Higher provider engagement and faster coding workflows.

Rapid adaptability and customization

EVE's deterministic formulas and agentic AI enable configuration updates in minutes instead of months, with no retraining required. Customers stay aligned with new HCC models, coding guidelines, and regulatory changes instantly.

Benefit: Flexibility to manage concurrent risk models (V28 and Rx-V08) and customize suspect filtering.

Agentic evidence extraction

Advanced generative AI replaces legacy OCR, extracting complex clinical indicators from all chart types (structured and unstructured). Evidence is extracted once, normalized into Reveleer's proprietary Clinical Language Corpus, then reused across infinite use cases at near-zero marginal cost.

Benefit: A single evidence layer supports prospective risk, quality, utilization, and future programs.

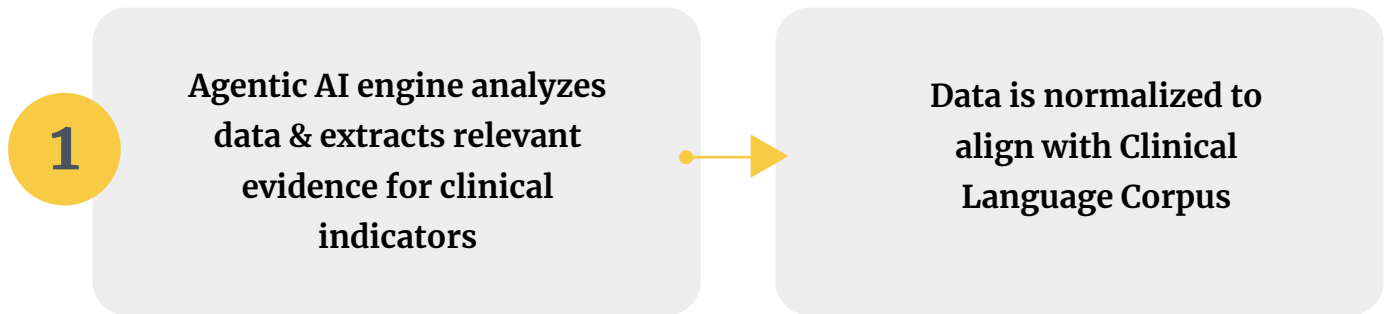

How EVE Hybrid AI works

EVE combines two core capabilities:

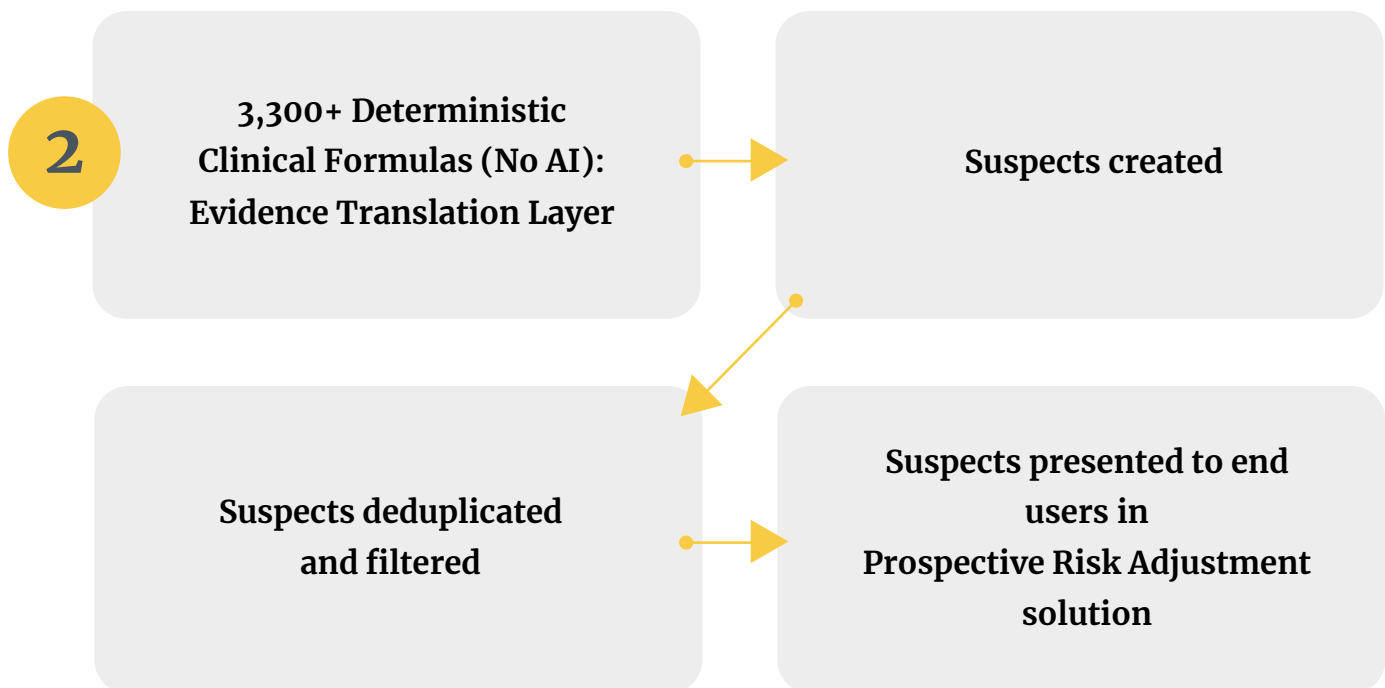

▶ Step 1: Evidence Extraction Agent

An agentic pipeline orchestrates multiple AI models to extract, validate, and normalize clinical evidence from patient charts into a standardized clinical corpus. This process handles complex language interpretation, temporal reasoning, negation detection, and family history disambiguation that legacy systems miss.

▶ Step 2: Deterministic Clinical Reasoning

A library of 3,300+ clinician-authored formulas interprets extracted evidence to deliver suspects. Each formula is transparent, editable by clinical teams, and applied deterministically. No AI makes clinical decisions—only humans do.

Key features

Streamlined evidence

One-click access to supporting source evidence. Reviewers locate source documentation in seconds, enabling efficient audits and reducing time spent hunting for proof.

Updated reason field

Displays clinical rationale behind each suspect. An at-a-glance description improves trust and enables faster decision-making.

Family vs. patient history discernment

Models distinguish patient conditions from family medical history, eliminating irrelevant flags that waste provider time..

Advanced filter configuration

Through advanced deduplication and condition filtering, Reveleer can dial customers' suspect volume and relevance thresholds up or down to match their organizational needs and resources.

Extract-once, apply-everywhere architecture

Clinical evidence extracted from charts persists as a longitudinal patient profile. The same enriched data powers prospective suspecting today, quality gap closure tomorrow, and future use cases without reprocessing.

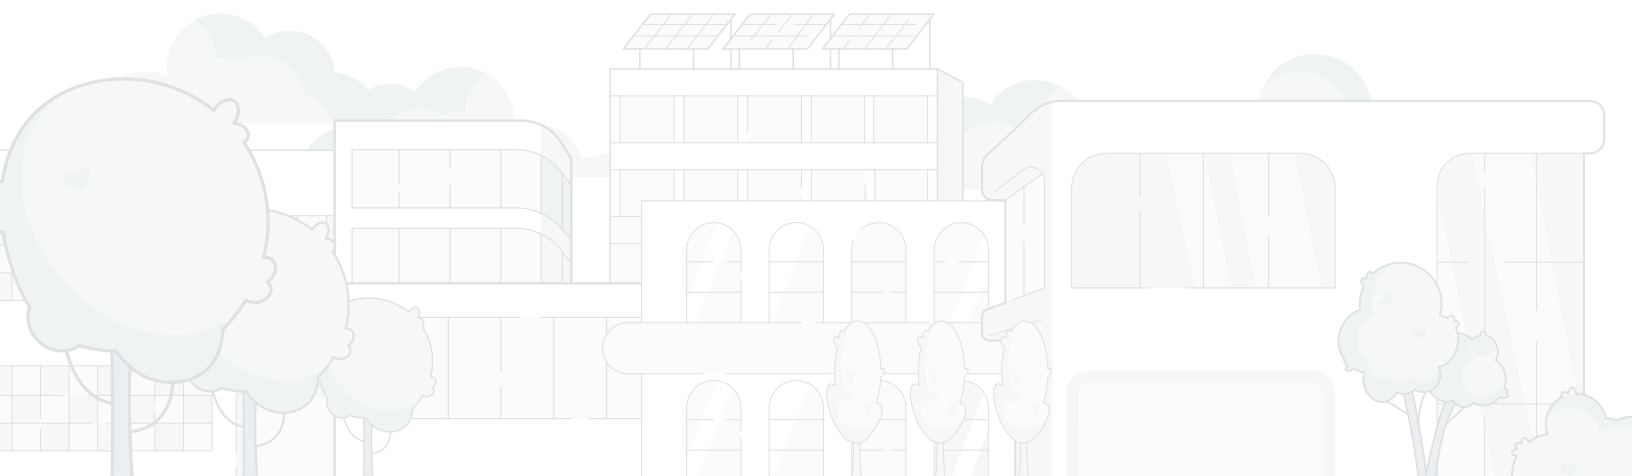

Performance & outcomes

EVE Hybrid AI delivers measurable improvements over legacy approaches:

Metric	Result
Noise Reduction	3x fewer irrelevant suspects
Nimble Regulatory Responsiveness	Expedites updates for regulatory changes; what previously took months can now be done in hours
Clinical Formula Library	3,300+ deterministic rules across risk models
Evidence Language Standard	Over 11,000 clinical indicators validated by clinical experts to produce a proprietary Clinical Language Corpus
Multi-Model Support	CMS V28, HHS V08, & Rx-V08
100% audit-ready output with transparent clinical reasoning	
Zero provider rework due to unexplained or unsupported suspects	

Why Reveleer is Different

Hybrid AI with human judgment

EVE fuses agentic evidence extraction with clinician-authored logic—not black-box scores. Clinical experts control every suspect decision through transparent, editable formulas.

Advanced evidence extraction over legacy OCR

EVE replaces outdated OCR with modern language understanding. It accurately interprets complex chart types, handwriting, checkboxes, and nuanced clinical language to normalize them into standardized evidence.

Workflow compatible, HITRUST secure

Full compatibility with Epic, Athena, and 45+ EHRs via modular API. Findings surface seamlessly in real-time workflows with HITRUST-level security and role-based access controls.

Consultative implementation experience

Unlike vendor lock-in approaches, Reveleer partners with customers to configure and validate the solution for their specific patient population and business needs, ensuring comfort and optimal setup.

Continuous improvement by design

The platform improves through clinician feedback; formulas and evidence rules evolve rapidly, reflecting best practices and regulatory changes.

Who Benefits

Providers & physicians

Receive sharper suspect lists with direct evidence and clinical reasoning. No workflow changes—findings surface seamlessly in the EHR. Focus time on care, not sorting through noise.

Risk adjustment managers

Achieve higher match rates with all suspects linked to granular chart evidence and documented clinical logic.

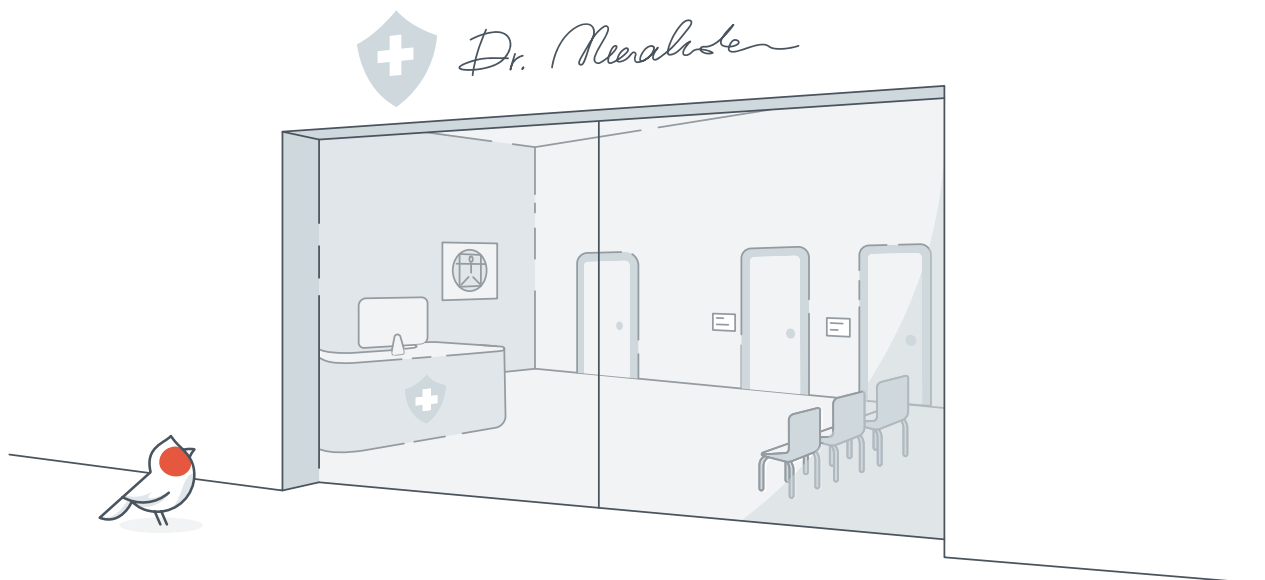

Compliance & audit leaders

All suspects are audit-ready with traceable evidence paths. Deterministic logic ensures every suspect meets compliance standards. Version history of every rule and formula supports post-audit reviews.

Health plan executives

Measurably improve provider NPS through higher-quality suspects and reduced abrasion. Adapt rapidly to coding and regulatory changes. Consolidate multiple vendor solutions into a unified, audit-grade prospective suspecting for market differentiation.

Reveleer's Commitment

Reveleer is committed to transparent, explainable, and scalable AI for value-based care. EVE Hybrid AI sets a new standard—separating AI evidence extraction from clinical decision-making. This hybrid approach ensures healthcare providers gain the pattern-recognition capabilities of AI while maintaining human control, clinical trust, and regulatory confidence.

Every suspect recommendation is provable, actionable, and auditable because every suspect is grounded in clear evidence and transparent clinical logic.
