Our Company

About Us

Since our beginnings in 2004, our company has strived to exceed customer expectations by the use of quality materials and workmanship, thereby adding beauty and value to residential and commercial properties. Whether buying through our network of dealers or contractors, nearly all of our products are manufactured, delivered, and installed by our very own team of skilled craftsmen. This allows us to focus on a consistent, hands-on approach to every product going through our facility, and avoids potential conflicts with third party contractors. There is no mass production here, as every product is individually constructed to each customer's exact specifications. Whether it is stylish and functional pavilion, a rustic timberline, traditional gazebo, or a customized pergola or awning, you can be confident in our abilities to meet and exceed your needs.

Mission

Our mission is to design, build, & install functional, customized outdoor structures that transform patios and backyards into shaded havens of connection and tranquility.

Vision

To create gathering places where families and friends can meet and enjoy the beauty of nature, craftsmanship, and relationship.

Core Values

Craftsmanship Quality of design, materials, and workmanship

Teamwork Seamlessly working together to achieve our mission and vision

Respect Treating people, property, and time with courtesy and kindness

A family owned company...

The company has been operating as a sole proprietor family owned business since its beginnings in 2004. After working for several years in the trade, Dean Troyer (owner) seized an opportunity to purchase business assets and equipment from a previous company, and thus began Pine Acres. Although there have been several changes in products and materials over the years, the commitment to satisfied customers has not.

The Troyer family enjoys various outdoor activities including hiking, fishing and traveling. The family is also active in church where Dean serves as a pastor. They desire to pass the Lord's blessings on to their customers.

FAQ's

- **How do you anchor structures down that do not have a floor?**

Answer: U shaped metal post brackets are fastened to the concrete or deck with anchor screws, then the posts are placed inside the brackets and secured through the sides of the brackets with screws. For areas without a solid surface to mount posts on to (a loose paver patio, dirt or grass area, etc) it is recommended to have holes dug below frost level and have the posts installed into the ground. Or concrete pilings can be poured to grade level and the posts can be mounted on top of the pilings with the above mentioned U brackets. The brackets are hidden either by a vinyl post sleeve or a wood trim collar.

- **How well do they hold up in wind?**

Answer: Many people are concerned about wind because of past experiences with other structures. We are very confident that our pavilions will withstand most wind storms when anchored down properly.

- **I have an odd sized patio and was wondering if you could make something to fit?**

Answer: Absolutely! Even though we have price lists with standard sizes listed, each one is considered custom and can be sized to fit.

- **Can you match the shingles on our house?**

Answer: While we have standard colors in stock, we have the capability to obtain most any brand of shingle and often times there is no additional charge for it.

- **Do the structures come assembled or what method is used to get it into my backyard?**

Answer: Structures are prepared in kit form at our manufacturing shop, then are hand loaded onto an enclosed trailer and delivered to the jobsite via a four wheel drive pickup truck. Pieces can be hand carried to the site if needed, therefore accessibility is usually not a problem.

- **Lead Times? And how long will it take to install a project?**

Answer: Lead times vary depending on workload and seasons. Typical lead time is approx 6-8 weeks but can be as high as 10-12 weeks during summer months. Depending on scope of the project, most structures are installed in less than a day (sometimes $\frac{1}{2}$ day), and usually no more than 2 days.

- **I want to place my structure right outside my back door... how do we keep rain water away from the house?**

Answer: Gutters can be mounted to divert rain water, and/or depending on the application, posts can be extended so water on the structure roof can drain into an existing gutter on the house.

- **Do you recommend staining my structure and if so, how often and what should I use?**

Answer: Although cedar and pressure-treated pine are very durable for exterior use, it is recommended to apply a coat of exterior deck stain/sealer approx every 2 years to enhance the appearance and help provide protection from the elements. If left unstained, cedar and pressure-treated pine will weather to a silverish gray color. Pine Acres offers staining at their manufacturing facility, and most staining is done prior to delivery.

Testimonials

Dean and his crew do excellent work. They built exactly what I asked for at a reasonable price, completed the on-site work in a short amount of time and on schedule. Everyone who has seen the work thinks its awesome.

-Jack from Pittsburgh

We had them design and build a custom pavilion over the existing concrete patio at our home. I cannot speak highly enough of the professionalism and quality of the work. The entire installation of the 15'x25' pavilion took approximately 5 hours from the time they pulled into our driveway until when they left after cleaning up. The four-man team worked seamlessly together, were experienced, and obviously enjoyed their work. I would highly recommend them.

-Denis from Pittsburgh

Excellent service, price was more than reasonable, install was fast, and most of all... the quality of workmanship was second to none.

-Rich from Cleveland

As a real estate investor, I normally always source materials and subcontractors on my own comparing quality versus price. For my custom pavillion I compared five other competitors in state and two out of state. Pine Acres' combination of quality, price, and construction cost represented the best value. They were not the absolute cheapest option, but they were easily the best value, and I respect and appreciate the personal touch Dean took every step along the way of this project. It was very easy and enjoyable top to bottom. I highly recommend this company to anyone looking for outdoor structures.

-Scott from Hartville

Treated Southern Yellow Pine

- **Strength** — Known as one of the strongest, most versatile species of exterior wood available, treated lumber remains a staple in the outdoor building industry.
- **Durability** — Pressure treated protection against, rot, decay, and insect bites.
- **Stability** — Unlike wet lumber purchased at home centers, the lumber used for our outdoor structures is kiln-dried before and after treatment to minimize cracking, warping and twisting and will readily accept stains and sealers soon after construction.
- **Economical** — Treated southern yellow pine is plentifully grown in the southern US, making access and availability widespread, meaning it is competitively priced.

Vinyl

- **Timeless Beauty** — Classical, sleek, and unaffected by the elements, vinyl products can add years of value to any home.
- **Durability** — Vinyl components are warranted against rotting, cracking and peeling for a lifetime of use.
- **Strength** — All exterior vinyl structural members are encased with pressure treated wood for strength and stability.
- **Low Maintenance** — Vinyl products are becoming more and more popular due to ease of maintenance, as there is no need for painting or staining which saves time and money. Occasional soap and water cleanup is all that is needed in most situations.

Western Red Cedar

- **Beauty** — Beauty in both sight and scent, with its rich tonal properties and natural luster, red cedar is renowned to architects and home owners around the world.
- **Durability** — Natural resistance to decay, moisture, and insect damage has made red cedar a premier material for both interior and exterior applications. Properly finished, western red cedar can last for decades in even the harshest of environments.
- **Stability** — Fine, straight grains and uniform texture helps lumber to lie flat, stay straight, and hold fasteners tightly.
- **Environmentally Friendly** — Wood is the world's only renewable building material, and western red cedar is sourced from one of the most sustainability managed forests in the world, with the majority coming from the Pacific Northwest of the USA.

6. Ceiling Options

Standard Ceiling

Exposed pressure-treated framing with 1x6 cedar sheathing. An optional wood sealer may be applied to reduce the graying effects of natural weathering. See page 15 for standard color choices.

Painted Ceiling

Framing can be stained to match main pavilion components or most any custom color. Sheathing boards can be stained in any of the 6 standard colors shown on page 15.

Cedar T&G Ceiling

Cedar tongue and groove boards are fastened to the underside of the roof framing for a finished appearance. An optional wood sealer may be applied. See page 15 for color choices.

Vinyl Ceiling

Beaded vinyl soffit is a maintenance friendly option, and is fastened to the underside of the roof framing for a finished appearance. Available in the three standard vinyl colors shown on page 12.

8. Installation Method

Option 1 Installed on Deck or Concrete Pad

Hidden galvanized post brackets and anchors are used for securing posts to solid, weight bearing surfaces. Brackets are hidden by either wooden trim collars or vinyl sleeves.

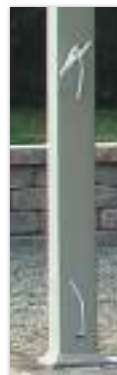

Option 2 Installed with Posts in Ground

Holes are dug below frost level, then pre-made concrete footer pads are placed at the bottom of each hole. The posts are then placed on top of the footer pads and the dirt is tamped back into place. This option is recommended for dirt areas, loose paver patios, or any other areas that do not have solid, weight bearing surfaces.

Rough Wiring Package

Includes channeling of one post to accommodate hidden wiring from switch to cross-brace for fan/light. Additional channeling or wiring for receptacles is available for an additional cost. Wire ends will be stubbed out and accessible for an electrician to do final hook up etc. 14/2 Romex is used unless requested otherwise.
