### Abstract

Recent work has demonstrated substantial gains on many NLP tasks and benchmarks by pre-training on a large corpus of text followed by fine-tuning on a specific task. While typically task-agnostic in architecture, this method still requires task-specific fine-tuning datasets of thousands or tens of thousands of examples. By contrast, humans can generally perform a new language task from only a few examples or from simple instructions – something which current NLP systems still largely struggle to do. Here we show that scaling up language models greatly improves task-agnostic, few-shot performance, sometimes even reaching competitiveness with prior state-of-the-art fine-tuning approaches. Specifically, we train GPT-3, an autoregressive language model with 175 billion parameters, 10x more than any previous non-sparse language model, and test its performance in the few-shot setting. For all tasks, GPT-3 is applied without any gradient updates or fine-tuning, with tasks and few-shot demonstrations specified purely via text interaction with the model. GPT-3 achieves strong performance on many NLP datasets, including translation, question-answering, and cloze tasks, as well as several tasks that require on-the-fly reasoning or domain adaptation, such as unscrambling words, using a novel word in a sentence, or performing 3-digit arithmetic. At the same time, we also identify some datasets where GPT-3's few-shot learning still struggles, as well as some datasets where GPT-3 faces methodological issues related to training on large web corpora. Finally, we find that GPT-3 can generate samples of news articles which human evaluators have difficulty distinguishing from articles written by humans. We discuss broader societal impacts of this finding and of GPT-3 in general.

# AI as a whole is no longer so open, GPT-4 (2023)

## 2 Scope and Limitations of this Technical Report

This report focuses on the capabilities, limitations, and safety properties of GPT-4. GPT-4 is a Transformer-style model [39] pre-trained to predict the next token in a document, using both publicly available data (such as internet data) and data licensed from third-party providers. The model was then fine-tuned using Reinforcement Learning from Human Feedback (RLHF) [40]. Given both the competitive landscape and the safety implications of large-scale models like GPT-4, this report contains no further details about the architecture (including model size), hardware, training compute, dataset construction, training method, or similar.

We are committed to independent auditing of our technologies, and shared some initial steps and ideas in this area in the system card accompanying this release.<sup>2</sup> We plan to make further technical details available to additional third parties who can advise us on how to weigh the competitive and safety considerations above against the scientific value of further transparency.

## AI is 'breaking' entry-level jobs that Gen Z workers need to launch careers, LinkedIn exec warns

BY JASON MA  
WEEKEND EDITOR

May 25, 2025 at 1:51 PM EDT

"Breaking first is the bottom rung of the career ladder," said LinkedIn's chief economic opportunity officer, Aneesh Raman.

GETTY IMAGES

# New data paints grim picture for entry-level workers (Brynjolfsson, 2025)

# New data paints grim picture for entry-level workers (Brynjolfsson, 2025)

This paper examines changes in the labor market for occupations exposed to generative artificial intelligence using high-frequency administrative data from the largest payroll software provider in the United States. We present six facts that characterize these shifts. We find that since the widespread adoption of generative AI, early-career workers (ages 22-25) in the most AI-exposed occupations have experienced a 13 percent relative decline in employment even after controlling for firm-level shocks. In contrast, employment for workers in less exposed fields and more experienced workers in the same occupations has remained stable or continued to grow. We also find that adjustments occur primarily through employment rather than compensation. Furthermore, employment declines are concentrated in occupations where AI is more likely to automate, rather than augment, human labor. Our results are robust to alternative explanations, such as excluding technology-related firms and excluding occupations amenable to remote work. These six facts provide early, large-scale evidence consistent with the hypothesis that the AI revolution is beginning to have a significant and disproportionate impact on entry-level workers in the American labor market.

# Will we have more automation or augmentation? (Brynjolfsson, 2022)

***Companies Are Pouring  
Billions Into A.I. It  
Has Yet to Pay Off.***

Corporate spending on artificial intelligence is surging as executives bank on major efficiency gains. So far, they report little effect to the bottom line.

Premise #4: Businesses need AI education

# Why? Strategy Questions

1. **How will AI enhance our core value proposition or create new revenue streams over the next 3–5 years?**

*Pushes leadership to think beyond incremental gains toward strategic transformation.*

2. **What are our competitors doing with AI, and how do we differentiate ourselves in this evolving landscape?**

*Promotes proactive positioning and market awareness.*

3. **Are we making build, buy, or partner decisions strategically — and do we understand the trade-offs of each?**

*Helps structure a scalable and cost-effective AI roadmap.*

4. **How are we future-proofing our AI investments to remain adaptable amid fast-moving technology and regulation?**

*Encourages resilience, flexibility, and regulatory readiness.*

# Why? Operational Questions

- 1. Do we have the infrastructure (e.g., cloud, compute, storage) in place to support model training, deployment, and scaling?**  
*Ensures technical feasibility and performance readiness.*
- 2. What is our process for testing, validating, and approving AI systems before they go live?**  
*Reduces operational risk and improves reliability.*
- 3. How will AI systems be monitored in production — and who is responsible for identifying issues or failures?**  
*Defines ownership and operational resilience mechanisms.*
- 4. Are we integrating AI into existing workflows in a way that augments, rather than disrupts, human decision-making?**  
*Focuses on practical adoption and user alignment.*

# Why? Data & Governance Questions

- 1. What data sources will power this AI system, and do we have clear rights and documentation for their use?**  
*Ensures lawful access, licensing clarity, and reduces IP/privacy risk.*
- 2. How are we assessing the quality, representativeness, and bias of the data we are using?**  
*Directly addresses model performance, fairness, and reliability.*
- 3. Who is responsible for data stewardship — including data updates, lineage tracking, and lifecycle management?**  
*Establishes operational accountability and long-term maintainability.*
- 4. Do we have mechanisms in place to detect and respond to data drift or model degradation over time?**  
*Promotes proactive monitoring and sustained system performance.*

# Why? People & Culture Questions

- 1. Do our employees understand how AI is being used in the organization, and are we communicating its impact transparently?**  
*Builds trust, reduces fear, and encourages engagement across teams.*
- 2. Are we investing in upskilling and training so that staff can work effectively with AI tools?**  
*Ensures that employees are equipped to adapt and collaborate with new technologies.*
- 3. How are we addressing concerns around job displacement, role changes, and ethical use of AI among our workforce?**  
*Fosters a culture of responsibility and psychological safety.*
- 4. Do we have champions or cross-functional teams in place to model responsible AI adoption and support cultural change?**  
*Encourages grassroots buy-in and organizational momentum.*
