

Synertech

Sterile, Single-use Dural Repair Pack

Background:

When spinal surgeons are operating, it is often in close proximity to the dura (the membrane that covers the spinal cord). This membrane can occasionally be punctured or torn by a surgical instrument. Alternatively, the dura can simply be adhered to surrounding tissue, and upon separation, a dural tear can occur.

When a dural tear occurs, the surgeon will need to stitch the dura using micro instruments, and a very small needle.

A dural tear can cause stress and tension in the operating room, and in such an environment it is not uncommon that:

- 1) The micro instrument set is not in the OR and may be difficult to locate.
- 2) A vascular surgeon has used the set and the spine surgeon is forced to use alternative, often inferior, instrumentation.

Pack Includes:

- 7" Micro Bayonet Forceps
- 7" Micro Scissors
- 7" Micro Needle Holder with Lock
- 6.0 Polypropylene Suture with 15mm 1/2 Taper Point Needle

The Solution - It Makes Perfect Sense:

- Sterile pack always ready at a moments notice in OR
- Innovative, precise instruments that work every time
- Reduced stress for Physician / OR team
- No concerns of lost / unavailable instruments
- No processing time, or sterilization costs
