

HubSpot CRM Integration

Connect once, import your contacts, and get validation results, including email scores, written back to your CRM fields automatically.

● DELIVERABLE ● RISKY ● UNDELIVERABLE

This guide provides step-by-step instructions for verifying emails using No2Bounce directly inside your HubSpot CRM account.

PREREQUISITES

- An active No2Bounce account: sign up free (includes 100 free verification credits)
- A valid HubSpot CRM account with access to Contacts, Leads, or Accounts modules
- No developer setup required: the integration uses OAuth and takes under 5 minutes

01 Go to CRM Integrations & Click Connect on HubSpot

Log in to your No2Bounce account. In the left sidebar, click **Email Validations**, then select the **CRM Integrations** tab at the top of the page.

You will see several integration options, including Salesforce and HubSpot. Click the **Connect** button on the HubSpot card to begin the authorization flow.

02 Sign In to Your HubSpot Account

You will be redirected to HubSpot's secure authentication page. Enter your HubSpot email address or mobile number and click **Next** to proceed with your password.

Alternatively, use one of the social sign-in options: Google, Apple, Yahoo, Facebook, LinkedIn, X (Twitter), or Microsoft. If you don't have a HubSpot account, click **Sign up now** to create one for free.

03

After signing in, HubSpot will display a permissions consent screen showing what No2Bounce is requesting access to. The permissions include:

- Group scope to perform CRUD operations on CRM metadata
- READ access to fetch data using CRM Object Query Language
- Perform CRUD operations on CRM modules (Contacts, Leads, Accounts)
- Group scope to update records in bulk

Check the "I allow No2Bounce to access the above data from my HubSpot account" checkbox, then click **Accept**. You will be automatically redirected back to No2Bounce.

No2Bounce only accesses your CRM data to read contacts and write validation results back. Your data is never shared with third parties.

04 HubSpot Is Now Connected: Click Import List

Once authorization is complete, you are redirected back to No2Bounce's CRM Integrations page. The HubSpot card now shows a green **CONNECTED** badge in the top-right corner, and two new action buttons appear:

- **Import List:** opens the HubSpot Integration contact management view
- **Disconnect:** safely unlinks your HubSpot account at any time

Click **Import List** to proceed to the next step.

05 Select Columns & Load Your CRM Data

The HubSpot Integration page opens with module tabs at the top: Home, Leads, Contacts, and Accounts. Select the module containing the records you want to verify.

Under **Choose Columns**, click the dropdown to select which fields to import. At minimum, select the Email column. You may also add Last Name, Full Name, First Name, or any other relevant fields for context. Then click **Load Data** to preview your records.

The Email column must always be selected: it is required for the validation process to run correctly.

06 Select Records & Click Validate Now

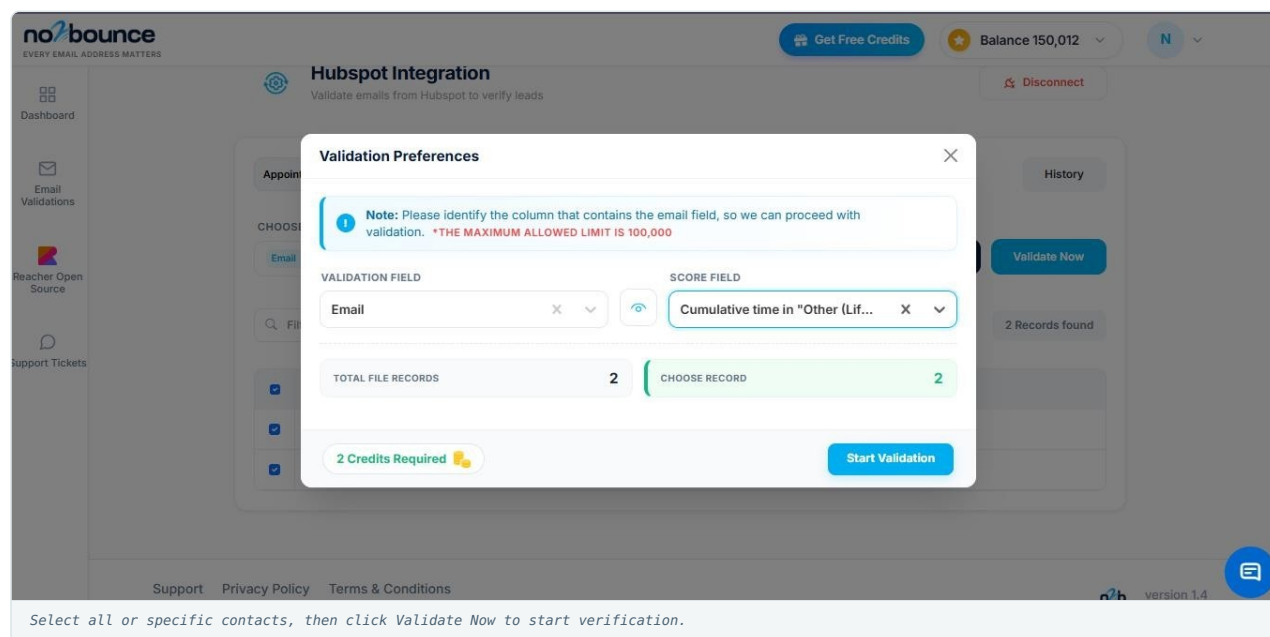

Your contacts load in a table showing all selected columns. Use the checkboxes to select individual records, or click the top checkbox to select all at once. You can also use the search or filter bar to narrow down specific contacts before selecting.

Once your selection is ready, click the **Validate Now** button in the upper-right corner to begin the email verification process.

The screenshot shows the no2bounce Hubspot Integration interface. The top navigation bar includes a 'Get Free Credits' button, a 'Balance 150,012' indicator, and a user profile icon. The left sidebar contains links to 'Dashboard', 'Email Validations', 'Reacher Open Source', and 'Support Tickets'. The main content area is titled 'Hubspot Integration' with a subtitle 'Validate emails from Hubspot to verify leads'. Below this, there are tabs for 'Appointments', 'Carts', 'CommercePayments', 'Companies', 'Contacts', and a 'History' button. The 'Contacts' tab is active, showing a 'CHOOSE COLUMNS' section with 'Email' selected. A 'Filter these records...' search bar is present, and a '2 Records found' indicator is shown. The table below has a header row with a checkbox and 'EMAIL', and two data rows: 'emailmaria@hubspot.com' and 'bh@hubspot.com'. A 'Load Data' button and a 'Validate' button are located to the right of the table. A blue chat icon is in the bottom right corner.

Search or filter to narrow down contacts before selecting.

The screenshot shows the no2bounce Hubspot Integration interface with the 'Validation Preferences' modal open. The modal has a close button in the top right corner. It contains a note: 'Note: Please identify the column that contains the email field, so we can proceed with validation. *THE MAXIMUM ALLOWED LIMIT IS 100,000'. Below the note, there are two sections: 'VALIDATION FIELD' with 'Email' selected, and 'SCORE FIELD' with 'Cumulative time in *Other (Lif...' selected. At the bottom of the modal, it shows 'TOTAL FILE RECORDS' as 2 and 'CHOOSE RECORD' as 2. A '2 Credits Required' indicator is shown, and a 'Start Validation' button is at the bottom right. The background interface is dimmed, showing the same 'Hubspot Integration' page as the previous screenshot. A blue chat icon is in the bottom right corner.

Select all or specific contacts, then click **Validate Now** to start verification.

CREDIT USAGE

Credits are debited based on the number of email addresses processed. Each email consumes 1 credit. Catch-All verification, if enabled, also consumes 1 additional credit per email.

07 View Validation Results & Download Report

After clicking Validate Now, you are redirected to the Validation Progress page. A circular progress indicator shows real-time completion percentage. Once complete (100%), results are displayed and automatically written back to your HubSpot CRM records.

The results summary breaks emails into three categories:

- **Deliverable:** valid, safe to send
- **Risky:** catch-all or uncertain
- **Undeliverable:** invalid, do not send

A Download Report option is available for 7 days after each run. The Validation History table below logs every past run, showing date, source, number of records, deliverable/risky/undeliverable counts, status, and a download link.

The screenshot displays the No2Bounce Hubspot Integration interface. At the top, there's a navigation bar with 'Get Free Credits', 'Balance 150,010', and a user profile. The main section is titled 'Hubspot Integration' with a 'Go back' and 'Disconnect' button. Below this, a progress indicator shows '100% Completed' for a validation run of 'hubspot_59db06c612ae0a6c3... (2 Emails)'. The results breakdown shows: Undeliverable: 0 (0%), Risky: 0 (0%), and Deliverable: 2 (100%). A 'Download' button is present. Below the progress indicator is a 'Validation History' section with a note: 'Note: Report Download available only for 7 days from creation'. A search bar 'Search history...' is also present. The history table has columns: Date, Source, Records, Deliverable, Risky, Undeliverable, Status, and Download. The table shows one entry for '27 May 2026' from 'hubspot' with 2 records, 0 deliverable, 0 risky, and 0 undeliverable. The status is 'Verifying...' and there is a 'View' button and a 'Progressing' button.

Date	Source	Records	Deliverable	Risky	Undeliverable	Status	Download
27 May 2026	hubspot	2	0	0	0	Verifying... View	Progressing

Validation Progress page at 100% complete, with results breakdown and Validation History log.

Results are automatically synced back to your HubSpot CRM. The Score Field and Validation Field you configured are updated on each contact record without any manual export needed.

Exported Fields in HubSpot CRM

After validation completes, the corresponding fields are written back to your HubSpot CRM contact records automatically. These fields are created on first validation, so you can use them right away to filter, segment, and build smart views inside HubSpot.

Catch-All Email Verification

When the Catch-All option is enabled during validation, No2Bounce performs a deeper check on domains that accept all incoming mail, helping you identify higher-risk addresses that a standard check may mark as valid.

- Catch-all verification consumes **+1 credit / email**
- Results are tagged in the N2B_SubStatus field as **catch_all**
- You can choose to enable or disable catch-all per validation run
