Staying Safe on **ChatGPT & Al Tools**

Al chat tools like ChatGPT boost productivity, but they're not secure places to share sensitive information. Anything entered could be stored, logged, or even exposed. At the same time, attackers are using AI to create more convincing scams than ever.

How Risks Arise

Unapproved Systems

Not all Al platforms meet company security standards. Using unapproved tools increases the chance of leaks or compliance issues.

> Tip: Only use Al systems approved by your organisation.

Think Before You Share

Al systems should be treated like public forums, not private databases. If you wouldn't post it on social media, don't type it into an Al tool.

> Tip: Always think twice before sharing information.

Data Exposure

Information entered into public AI tools may be stored or reused. Sharing confidential company or customer data could put your business at risk.

Tip: Never paste confidential information into Al tools.

AI-Powered Scams

Attackers use AI to write polished phishing emails, fake documents, and even realistic images or voices. These are harder to spot than traditional scams.

Tip: Stay alert—Al can make fraud look more legitimate than ever.
