

If you're like most global enterprises, your mainframes still run the business-critical workloads: financial transactions, healthcare records, public infrastructure. But most security tools act like those systems don't exist. They focus on cloud and SaaS, ignoring the decades of sensitive data locked inside your legacy environments.

Touch.io MSPM (Mainframe Security Posture Management) changes that. It brings your mainframe data into the same security and governance program as everything else. So, you can see it, understand it, and protect it—without disrupting your operations.

1touch.io MSPM gives your team the visibility and control they need to manage mainframe data like any other part of the enterprise:

Find and classify sensitive mainframe data—even when you don't have copybooks.

Map entitlements by integrating directly with RACF and other access control tools

Automate policy enforcement with tagging, access reviews, and data lineage tracking

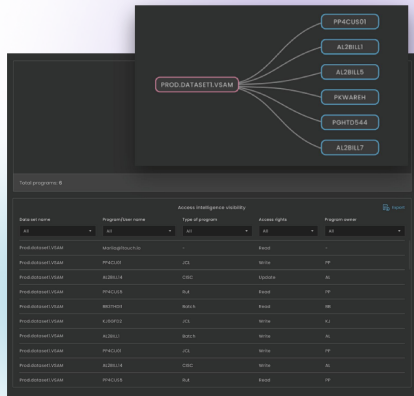

Deploy in high-assurance environments, including air-gapped infrastructure

You get consistent protection, fewer blind spots, and governance that works at scale.

A Smarter Way to Discover and Govern Mainframe Data

You can't secure what you can't see. MSPM gives you the visibility and context you need—without requiring agents, credentials, or scheduled scans.

Here's what that means for you:

Real-time visibility into sensitive data exposure

Fewer false positives with ML and NLP-based classification

One unified inventory across mainframe, cloud, SaaS, and hybrid systems

Context-rich records that show who accessed what, when, and why

Less manual cleanup, so your team spends time solving issues—not finding them

Designed for Global Enterprise Demands

Itouch.io MSPM is built for the realities you face every day:

Connect the dots across silos

No more static inventories. Understand how data relates across platforms—and uncover high-risk combinations that would otherwise go unnoticed.

Automate the governance grind

Stop chasing down exceptions. Let the platform handle tagging, encryption checks, and compliance triggers automatically.

Fit security-first environments

MSPM runs in air-gapped, heavily regulated, and secure networks. And with audit trails built in, you're ready when auditors come calling—no spreadsheets required.

What You Gain

Agentless, lightweight deployment: Scan VSAM, Db2Z, IMS—even without copybooks. No agents. No performance hit.

Policy-driven data control: Classify by business context, data type, risk level, and compliance need. Apply controls automatically.

Contextual lineage and access mapping: Understand how data flows across users, systems, and time.

Eliminate blind spots: Discover structured and unstructured data at rest and in motion—everywhere it lives.

Why It Matters

If your mainframe data is disconnected from your security and governance program, your risk picture is incomplete. Itouch.io MSPM helps you close that gap—without adding overhead or complexity.

You get better visibility, stronger enforcement, and faster audits. And your mainframe becomes part of your enterprise strategy—not a blind spot you hope no one notices.

Don't Let Mainframe Data Stay in the Dark

Your security posture is only as strong as your most exposed environment. With Itouch.io MSPM, you gain unified control across your entire data estate—cloud, mainframe, and everywhere in between.
