

AI PrivDetect

Privilege risk prioritization for confident, defensible review

Focus attorney judgment where privilege risk is highest with explainable AI scoring that supports smarter review decisions. Reduce over-review, improve consistency, and apply privilege judgment more defensibly at scale.

Introducing AI PrivDetect

Meet the privilege risk analysis solution that helps legal teams prioritize review without guessing. AI PrivDetect evaluates documents against multiple privilege-related attributes and assigns clear Low, Medium, or High likelihood scores, giving attorneys early visibility into where privilege risk is concentrated. By pairing explainable AI scoring with human judgment, AI PrivDetect helps teams reduce over-review, apply privilege consistently, and defend how review decisions were prioritized.

OFFERING AT GLANCE

Secure Private Infrastructure

AI PrivDetect operates entirely within Consilio's secure, privately hosted infrastructure, ensuring sensitive data never leaves controlled environments. All analysis is performed without reliance on public cloud AI services, supporting strict security, privacy, and regulatory requirements. This foundation gives legal teams confidence that privilege risk assessment is conducted in a manner appropriate for high-stakes and highly sensitive matters.

Risk Privilege Prioritization

Large document populations can be evaluated in a single workflow to reveal where privilege risk is most concentrated. AI PrivDetect applies privilege-related scoring logic across the dataset, allowing teams to move away from treating every document as equally risky. This targeted prioritization helps attorneys focus their judgment where it matters most while lower-risk material moves through review more efficiently.

Explainable AI Scoring

Each document scored by AI PrivDetect includes clear, attribute-level reasoning that explains why privilege risk was identified. Attorneys can review the underlying logic, validate the assessment, and use likelihood scores flexibly across workflows, from targeted quality control to tiered review. Higher-risk scores can be prioritized for deeper scrutiny, while lower-risk material can move efficiently through review.

Configurable, Scalable Consistency

Privilege risk is evaluated using scoring logic that can be tailored to the specific standards, benchmarks, and risk tolerance of each matter. AI PrivDetect applies this logic consistently across large document populations, regardless of reviewer, custodian, or review phase. This flexible yet uniform approach reduces reviewer variance, strengthens quality control, and supports defensible privilege practices across complex, multi-reviewer matters.

Expert Guided Oversight

AI PrivDetect is designed to inform review strategy, not replace legal judgment. Attorneys remain fully responsible for privilege determinations, using AI-generated scores to guide attention and review sequencing. Consilio's AI and Managed Review teams monitor performance and support validation, ensuring outcomes remain accurate, auditable, and aligned with case strategy.
