

The vRx 2.0 Platform & vIntelligence

The cybersecurity industry runs one way. We run the other, on purpose.

vIntelligence

Agentic AI exposure validation layer. Runs exploit simulation against the fixed asset to confirm the exposure is actually closed, not just patched on paper.

Proof of remediation, not a claim of it

vRx Agent

Ingests the full SBOM to find vulnerabilities across applications and operating systems. Also provides continuous context on config, exposure state, and dev/prod status.

vRadar

Agentless discovery, network, OWASP Top 10, full vulnerability, and compliance scanning.

Three remediation paths, one platform:

vPatch

Automated patch deployment across OS and third party

vScript

Public, private, and AI generated fixes

vShield

Patchless, virtual patching for zero days

One platform for every remediation path.

vScore

One score that fuses multiple signals so teams stop triaging on severity alone:

CVSS

EPSS

CISA KEV

Asset context

Network context

Severity, exploit likelihood, known exploitation, and environmental risk, in one number.

Compliance and audit evidence

Generated automatically from every Stage 4 validation. Each validated fix feeds a tamper-evident audit trail and certified reports mapped to the frameworks your auditors ask for:

PCI-DSS 4.0

HIPAA

CMMC

CYBER ESSENTIALS

200+ CIS BENCHMARKS
