

# Self-Storage Hallway Systems

Increase rentable space and maximize revenue with SteelBlue's pre-engineered self-storage hallway systems. Designed to create efficient corridors and well-defined units, our systems optimize your layout while providing secure, easy access with high-quality self-storage doors. Contact us to learn how we can enhance your facility.

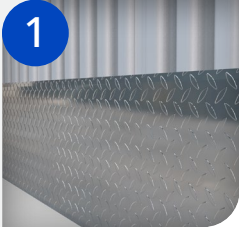

## Flush or Corrugated Wall and Header Systems

SteelBlue offers flush or corrugated wall and header systems to provide a finished look using customizable options to meet the specific needs of your storage facility. A flush wall and header system offers a smooth surface for a smooth and eloquent look. The corrugated wall and header system provides your facility with a more industrial look and feel.

Flush

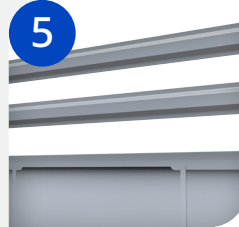

Corrugated

1

### Kick Plate

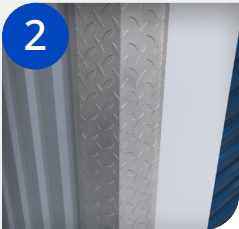

Installed at the bottom of the hallway system, kick plates assist in preventing potential damage caused by any hall traffic. Kick plates help create a complete look to your hallway system and are available in 20-gauge galvanized steel and aluminum diamond plate.

5

### Burglar Bars

The bars above a hallway system or unit partition are called burglar bars. Like wire mesh, these bars help secure the space above the top of the hallway system.

2

### Corner Guard

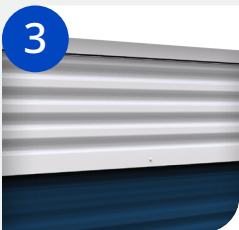

Similar to kick plates, corner guards protect the corners in the hallway. The aluminum diamond plate corner guard is available in lengths up to 10 ft.

6

### Roll-Up Door

A roll-up door is made of interlocking metal sheets designed to roll-up along a guide into a coil directly above the opening. Roll-up doors protect your belongings against unwanted entry and natural elements.

3

### Header Panel

The header panel is used in interior applications to enclose the area between the top of the door and the hallway system. This product is available in either flush or corrugated.

7

### Latch

SteelBlue offers a comprehensive range of latch solutions carefully constructed to ensure durability, with options including stainless steel, chrome, and other specialized finishes to suit various applications.

4

### Bottom Bar

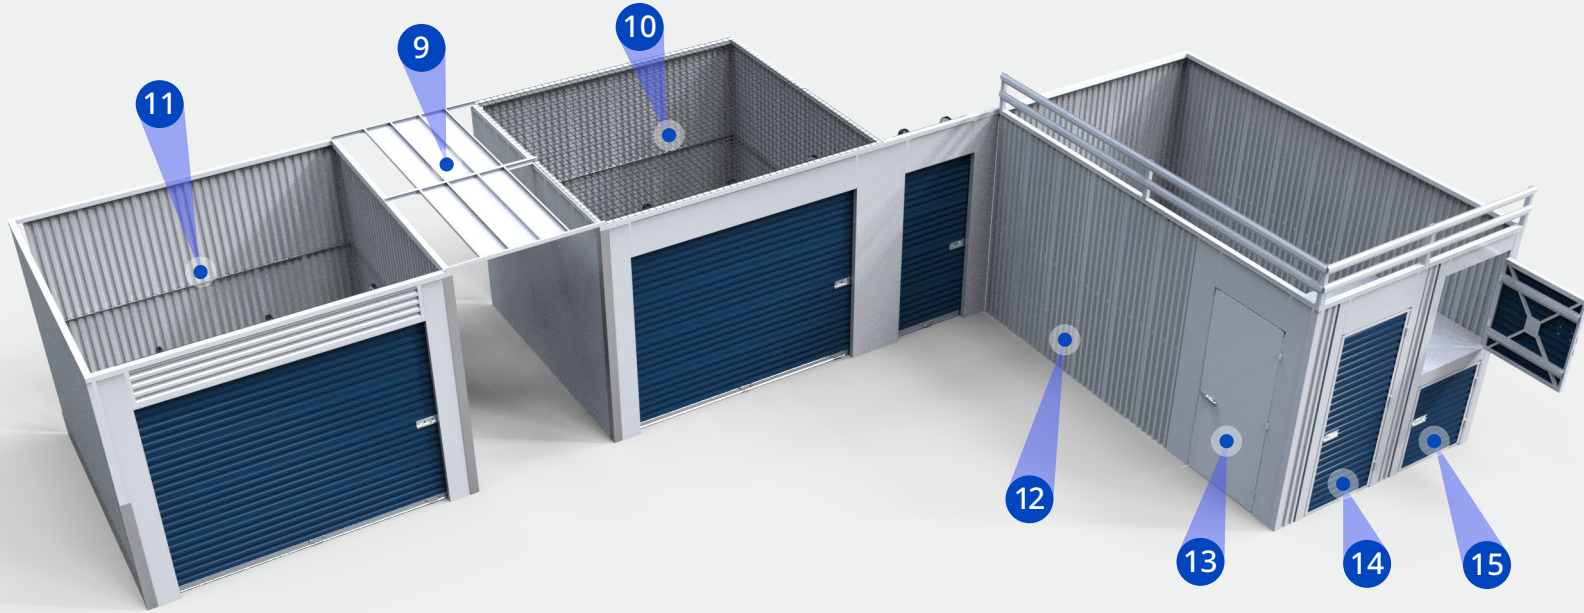

Designed to protect the door against weather as well as reduce damage and wear. SteelBlue's bottom bars are constructed using 6063-T3 aluminum and feature a vinyl weather seal that can be changed without replacing the entire door.

8

### Roll-Up Frame

The flush roll-up frame is designed to be durable and maximize unit space.

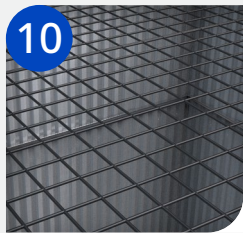

**9 Soffit**

Soffit is installed at the ceiling between a hallway system to offer an attachment point for lighting. Additionally, it hides unsightly mechanical components such as HVAC and electrical.

**13 Flush Swing**

Typically used for mechanical rooms or storage closets for facility owners. With optional louvers for increased air flow.

**10 Mesh**

Wire mesh is used at the top of storage units with overhead gaps that might allow entry. The mesh provides light and airflow inside the interior hallway system while keeping the items inside the unit secure.

**14 Swing Door**

For smaller spaces, using a swing door may be a great option. A swing door has two or three hinges (depending on size) that allow the door to swing outward.

**11 Unit Partition**

The mid-span horizontal bracing supports increase wall strength and utilize hem-and-channel construction to eliminate sharp edges. This durable solution combines strength with safety and visual appeal in an affordable package that accommodates unusual loads placed on walls.

**15 Locker Door**

The locker door is half the size of the standard swing door and can be installed in stacked configurations.

**12 Wall Panel**

The wall panels provide the facility with a finished look and enclose the unit. These panels are available in a flush or corrugated profile.

**ADA Kits**

The Americans with Disabilities Act of 1990 (ADA) requires 5% of the first 200 self-storage units and 2% of the self-storage units over 200 to be accessible. SteelBlue includes a looped pull rope with all doors to comply with the ADA.
