

## **Besso raises CHF 4 million to accelerate the growth of its trade regulation intelligence platform**

**Bern, Switzerland, 8 October 2026.** Besso has secured CHF 4 million in new funding to accelerate its next phase of growth. The investment comes from a large European single family office, which will remain undisclosed in accordance with its preference for privacy.

The funding follows a period of strong commercial traction. Besso already works with global leaders such as Danone, Unilever, AB-InBev, and several further Fortune 500 companies have recently joined its customer base. Until now, the company has been built with a deliberately lean and largely bootstrapped approach.

“We have always been very deliberate about building Besso around real customer demand rather than funding milestones,” said Philip Sieber-Gasser, Founder & CEO of Besso. “The traction we are seeing now tells us that the time is right to invest more aggressively in growth. Having one long-term investor take the entire round gives us both the resources and the focus to do exactly that.”

Besso helps multinational companies navigate the growing complexity and cost of global trade. Its technology and expertise enable companies to identify and capture opportunities within their international trade flows, particularly as tariffs, trade barriers and geopolitical uncertainty increasingly affect global supply chains.

The CHF 4 million investment will primarily support three areas: growing Besso’s team, expanding its capacity to serve a rapidly growing base of multinational customers, and advancing its technology platform through continued investment in product development and R&D.

“This is an important milestone for us, but the funding itself is not the destination,” Sieber-Gasser added. “What matters is what it enables us to build from here.”

### **About Besso**

Besso helps multinational companies turn the growing complexity of trade regulation into competitive advantage. Combining technology, data and deep trade expertise, Besso identifies opportunities to reduce trade-related costs and improve the resilience of international supply chains.
