

# Secure financial data without trusting devices

Financial services runs on mobile access, third parties, and speed. Attackers know it. Phishing and social engineering increasingly target users directly on their devices, where traditional controls have limited visibility.

Corporate owned devices typically rely on MDM. That brings device level control and operational overhead, but sensitive data can still reside on the endpoint. MDM itself has been bypassed in real world exploits, including kernel level attacks.

BYOD strategies often rely on MAM. Protection is limited to managed applications. Notifications, screenshots, and activity outside those apps can still introduce risk.

Different models. Same exposure.

When regulated financial data reaches the device, loss or compromise can increase the impact of an incident.

## Hypori for Financial Services

### Zero data on device

Regulated data remains in the secure environment rather than on endpoints, reducing exposure tied to lost or compromised devices.

### COPE and BYOD without device trust

Reduce reliance on invasive device control models and limit blind spots created by app only management.

### Simplified oversight

Centralizing sensitive data enforces logging, retention, and access controls in one place, helping streamline audits and support frameworks like GLBA and SOC based controls.

### Lower operational complexity

Fewer device level controls can reduce policy sprawl and ongoing support burden.

## Why this matters now

Mobile centric attacks increasingly target frontline employees directly. AI driven impersonation and phishing accelerate faster than traditional endpoint tools can respond.

Trying to out manage every device is a losing game. Architecturally removing sensitive data from endpoints changes the risk equation.

Hypori protects financial data at the edge by keeping it off devices. Support COPE. Enable BYOD. Reduce exposure.

Security that aligns with how financial teams actually work without assuming every device can be fully trusted.

Protect financial data at the edge.  
Without trusting the device.
