

Hypori

One Device, **Zero** Worries

2025.3.2 Release

Oct 29th, 2025

Hypori Platform 2025.3.2 Release

This minor release delivers reliability improvements and refinements that enhance the overall user experience. It is available to all Hypori Cloud customers on AWS, including customer-managed accounts.

- Improved reliability of app downloads during virtual device startup, ensuring apps install consistently even when network connectivity is unstable.
- Resolved an issue where enabling Touch ID caused the Sherpany and Futurae apps to crash on iOS devices. Touch ID now works as expected.
- Ensured the device camera continues to function correctly with recent Chrome updates that introduce video stabilization.
- Improved reliability when updating apps that use different internal package names by ensuring clean uninstall and re-install behavior.
- Added IPv6 support for virtual devices to meet the requirements of certain applications, including Cloudflare WARP and Zscaler VPNs.
- Enhanced virtual device policy controls to provide better management of Kiosk mode features.

Console 2.0

Group Managers now only see the client and virtual device policies they are authorized to manage when filtering virtual devices.

Infrastructure

Core platform networking components and Kubernetes plugins have been upgraded to improve overall system stability, reliability, and support ongoing platform enhancements.
