

Hypori

One Device, **Zero** Worries

2026.2.1 Release

July 16th, 2026

Hypori Platform 2026.2.1 Release Notes

The Hypori **2026.2.1** release includes targeted enhancements and bug fixes that improve reliability, usability, and overall user experience. This release also includes the latest security updates across components. It is supported by continuous security scanning and a consistent patching strategy to maintain a strong security posture and support ongoing compliance requirements. This release is for Hypori Cloud environments on AWS, including customer-managed accounts.

Enrollment Portal Improvements

This release streamlines Purebred credential registration and adds a new administrative control for the Enrollment Portal.

- Users generating derived credentials are now taken directly to the OTP page in the Purebred Portal, reducing the number of clicks required to complete registration.
- Administrators can now disable user access to self-service pages during scheduled system maintenance.

Console 2.0 Improvements

This release expands visibility into virtual device states and improves data grid usability.

- Group Managers can now see virtual device transitional states, a capability previously available only to Administrators.
- Columns in data grids can now be resized, giving users more control over how information is displayed.
- Clicking anywhere on a table row now selects the row. Previously, users had to click directly on the checkbox.

App Gallery Improvements

This release improves App Gallery reliability and reduces disk usage during app installation.

- Fixed an issue where the Hypori App Gallery app could get stuck in an infinite loop while attempting to update itself to a newer version.
- Apps are now streamed during installation instead of being stored as a temporary copy on the virtual device disk, reducing pressure on user data disk space.

Hypori Assist Improvements

This release improves diagnostic file management and adds new visibility into PKI credential status in Hypori Assist.

- Diagnostic files can now be marked as "Done," which sets their expiry to 7 days to automatically clean up resources that are no longer needed. An Expiry column in the diagnostics file list now shows the countdown, with a warning indicator as files approach expiration.
- Users can now view PKI credential health status and download credential diagnostic files for troubleshooting, giving IL5 users better visibility into their Purebred credentials.

Enhanced Offline Notifications

Administrators can now override enhanced offline notification settings at the child group level, even when the setting is enabled at the parent. Previously, enabling at the parent forced all child groups to inherit the setting with no way to disable or change it individually.

Security

This release extends TLS 1.3 support and includes routine security patching and remediation work.

- Extended TLS 1.3 support to SaaS customers across all web and client traffic, including Console, the Enrollment Portal, and Hypori client apps.
- Applied Android security patches for April, May, and June 2026.
- Applied RHEL 8 security patches.
- Remediated Security Hub findings related to security group rule configurations.
