========== Ask publishers to revive access to over half a million books. Listen as Bookshelf reads the passage aloud. Easily find eTextbook material anywhere, anytime. Search for book content, images, and your workbook. Learn More Institutions from 4500 worldwide, 230 countries & territories, 10K+ publishers, 18M+ active users. Flash Player required to view video. The textbook covers various topics: arithmetic in Z Revisited, congruence in Z and modular arithmetic, rings, arithmetic in F[x], congruence in F[x] and congruence-class arithmetic, ideals and quotient rings, groups, normal subgroups and quotient groups, topics in group theory, arithmetic in integral domains, field extensions, Galois theory, public-key cryptography, the Chinese Remainder Theorem, geometric constructions, algebraic coding theory. Author Thomas W. Hungerford is a renowned expert with an M.S. and Ph.D. from the University of Chicago. He has taught at several institutions, including the University of Washington and Cleveland State University. Hungerford currently works at St. Louis University. Hungerford has authored numerous influential textbooks for undergraduate and graduate-level courses. His notable books include Abstract Algebra: An Introduction, Algebra (Springer), Mathematics with Applications (Pearson), and Contemporary Precalculus (Cengage). The book's 10th edition features an alternate approach allowing instructors to cover rings before groups or vice versa. The textbook includes over 350 examples and 1600 exercises, making it suitable for courses of varying lengths and mathematical sophistication levels. The text is organized around two themes: arithmetic and congruence. It starts with the integers and then develops concepts for polynomials and groups, emphasizing clarity and exposition. The book can be tailored to fit different course lengths and student abilities. Cengage provides supplementary materials that align with the main textbook edition. ========== This professor has work at Washington and Cleveland State University and now he is teach at St Louis University. He do research on algebra and math education. He write many books for student and graduate level. These include: Algebra, abstract algebra introduction; Mathematics with applications, tenth edition; and pre-calculus contemporary approach.
