

Connections Tour 2026 Training Course Abstracts

Join Domo Connections early for a 90-minute, hands-on workshop, with plenty of time for Q&A after. Read the course descriptions below to determine which course is right for you.

Building with AI in Domo [Beginner]

Put Domo's AI to work without needing to know how any of it works under the hood. This hands-on workshop starts with the request we hear most — turning messy, unstructured files into governed, structured data — and shows you how to do it yourself with Magic AI tiles. From there you'll build with Co-Work agents in Magic and App Studio, and see the newest Domo AI Chat capabilities. You'll work in the Connections demo instance: we hand out logins and get you set up in the first few minutes, with sample PDFs and a dataset already loaded. All you bring is a laptop.

Key Takeaways

- Use Magic AI tiles to convert PDFs and other unstructured sources into structured, governed datasets.
- Build a Magic flow and an App Studio page with Co-Work agents, plus the latest Domo AI Chat capabilities.
- Learn best practices and shortcuts from Domo's product experts, and leave with the know how to build in your own instance.

Attendee Requirements

- Attendee-provided laptop required
- Difficulty level: Beginner

Introduction to Domo Agents and Headless AI Creation [Intermediate]

Go from using AI in Domo to building with it. We start with the foundations — what an agent, a tool and a skill actually are — then tour the Domo-provided agents and toolkits available today. You'll build your own agent, give it a custom toolkit to call, embed it where your users already work, and see where workflow agents fit. The last stretch goes headless: connect an external AI client to Domo MCP Basic and use Domo tools from outside Domo. Everything runs in the Connections demo instance, with logins provided and set up at the start — bringing your own AI client is preferred, not required.

Key Takeaways

- Build a Domo agent and a custom toolkit, and embed an agent in your own site.
- Navigate the AI Library and the agents and toolkits available now, plus what's on the roadmap.
- Connect an external AI client to Domo MCP Basic and use governed Domo tools outside Domo.

Attendee Requirements

- Attendee-provided laptop required
- AI client preferred
- Difficulty level: Intermediate

Advanced Headless AI Orchestration [Advanced]

For teams already running agents in production. You'll connect your own AI client to the Connections demo instance in the opening minutes, then work through Domo MCP set up and governed queries, skills for granular tool-use context, and building and registering your own custom MCP server. You'll also get first hands-on time with the new agentic Domo CLI — ultimate power, and the responsibility that comes with fewer guardrails than the MCP protocol enforces. We close by orchestrating a multi-step job, with governance holding at every call. Taught with Claude, with written set-up instructions for Gemini Pro and Codex.

Key Takeaways

- Write skills, build and register a custom MCP server, and chain a multi-step orchestration against Domo.
- Use the new agentic Domo CLI, and understand where its guardrails differ from MCP.
- Automate Domo, or automate other systems with Domo in the loop, from your existing agent tooling.

Attendee Requirements

- Attendee-provided laptop required
- AI client required
- Difficulty level: Advanced
