

AN INTRODUCTION TO THE WATER-FED POLE

- **How do water-fed poles work?**

The water-fed pole uses regular tap water and a de-ionized water filtration unit. The de-ionizer reduces the particles found in water from about 400 particles per million (ppm) to about 1 ppm. The water is pumped through the brush and sprayed on the window while the cleaner uses the brush to scrub the glass. The “pure” water is then used to rinse the dirt away and the window dries spot-free!

- **We use water-fed poles because they are safe.**

Ladders and lifts can be impractical or too dangerous for hard-to-reach windows. The water-fed pole allows our cleaners to keep two feet on the ground while effectively cleaning your windows.

- **They're also environmentally-friendly!**

The water-fed pole uses just one substance – pure water!
