

SAGGING FLOORS?

Restore the integrity of your home by stabilizing your floors with adjustable steel support posts.

UNITED STRUCTURAL SYSTEMS
USSS

STEEL SUPPORT POSTS

Common Causes of Uneven Floors

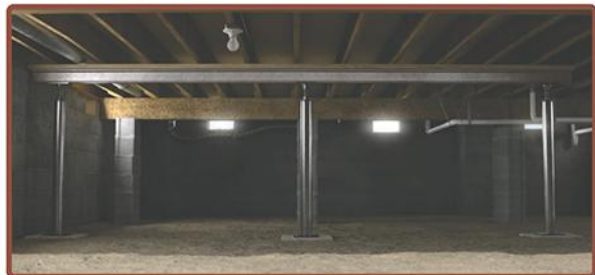

- Shifting, settling soil
- Wood rot, moisture, mold or mildew
- Poor maintenance, poor design
- Deterioration of older homes
- Invasive wood damaging pests

Moisture related wood rot can be a cause of sagging floors.

Drywall cracks are common signs of foundation problems.

Correct and stabilize sagging floors with a steel support post, also known as a crawl jack, that can be adjusted to accommodate movement in the settling soil beneath your home. To address moisture issues that may be compromising the integrity of your floors, consider additional crawl space repairs such as crawl space encapsulation or crawl space waterproofing.

The USS Difference

- Warranted adjustments for 5 years
- ICC-ES certified and code compliant
