

# RWA Vault

*Designed for professional and scaled capital, with structured liquidity and issuer backed redemptions.*

The RockawayX Real World Asset (RWA) Vault offers exposure to rigorously diligence RWAs and institutional yield bearing assets on Solana, starting with OnRe, Huma, Figure, and Solstice. The vault provides a single access point to a diversified pool.

Underpinned by RockawayX's institutional risk underwriting, ongoing monitoring, and automatic rebalancing, the vault reduces single-asset concentration to deliver a more resilient yield profile that is less dependent on broader crypto market cycles.

## Key Facts

- **Robust Infrastructure:** Built on Kamino, Solana's dominant lending market
- **Single access point:** One USDC deposit for diversified yield exposure
- **Automatically rebalanced:** Allocations optimized to pursue the best risk-adjusted returns
- **Institutional risk framework:** Underwriting, ongoing monitoring, and concentration controls that have been proven over RockawayX's 4+ year successful market-neutral strategy track-record are applied to the vault

## RWA Portfolio

The vault curates yield across high-quality and uncorrelated RWAs and yield bearing assets, including:

- OnRe: Structured exposure to reinsurance-linked yield.
- Huma: Yield sourced from cross-border payments and financing activity.
- Figure: Yield linked to home equity loans and credit exposures.
- Solstice: Yield from on-chain lending markets and yield-bearing stablecoin strategies.

## Risk Management & Safeguards

RockawayX has an unmatched track-record in risk underwriting, as its market-neutral yield investment strategy (~\$150m AUM) has had no down months in 4+ years running it and zero counterparty defaults, while returning double-digit annual returns and providing flexible liquidity across DeFi protocols.

The RWA vault applies RockawayX's tested institutional risk framework, including underwriting and ongoing monitoring of collateral types and venues. Strategies are selected based on verifiable structure and operating history and ongoing diligence on counterparties, collateral, and on-chain performance.

Allocations are optimized and automatically rebalanced to manage exposure, yield, liquidity, and risk, with the aim of delivering consistent, market-neutral outcomes for users.

## How it Works

- Deposit USDC: Users deposit USDC into the vault and receive a liquid vault token representing their share.
- Automated Allocation: RockawayX allocates capital across RWA-backed lending markets, optimizing for yield while following strict risk parameters.
- Continuous Rebalancing: The vault automatically rebalances positions based on market conditions, utilization rates, and collateral quality.
- Earn Yield: Depositors accrue yield passively, with returns compounding directly into their vault position.
- Withdraw Anytime: Redeem the vault token for USDC at any time, subject to available liquidity in underlying markets.
