robust sustainability

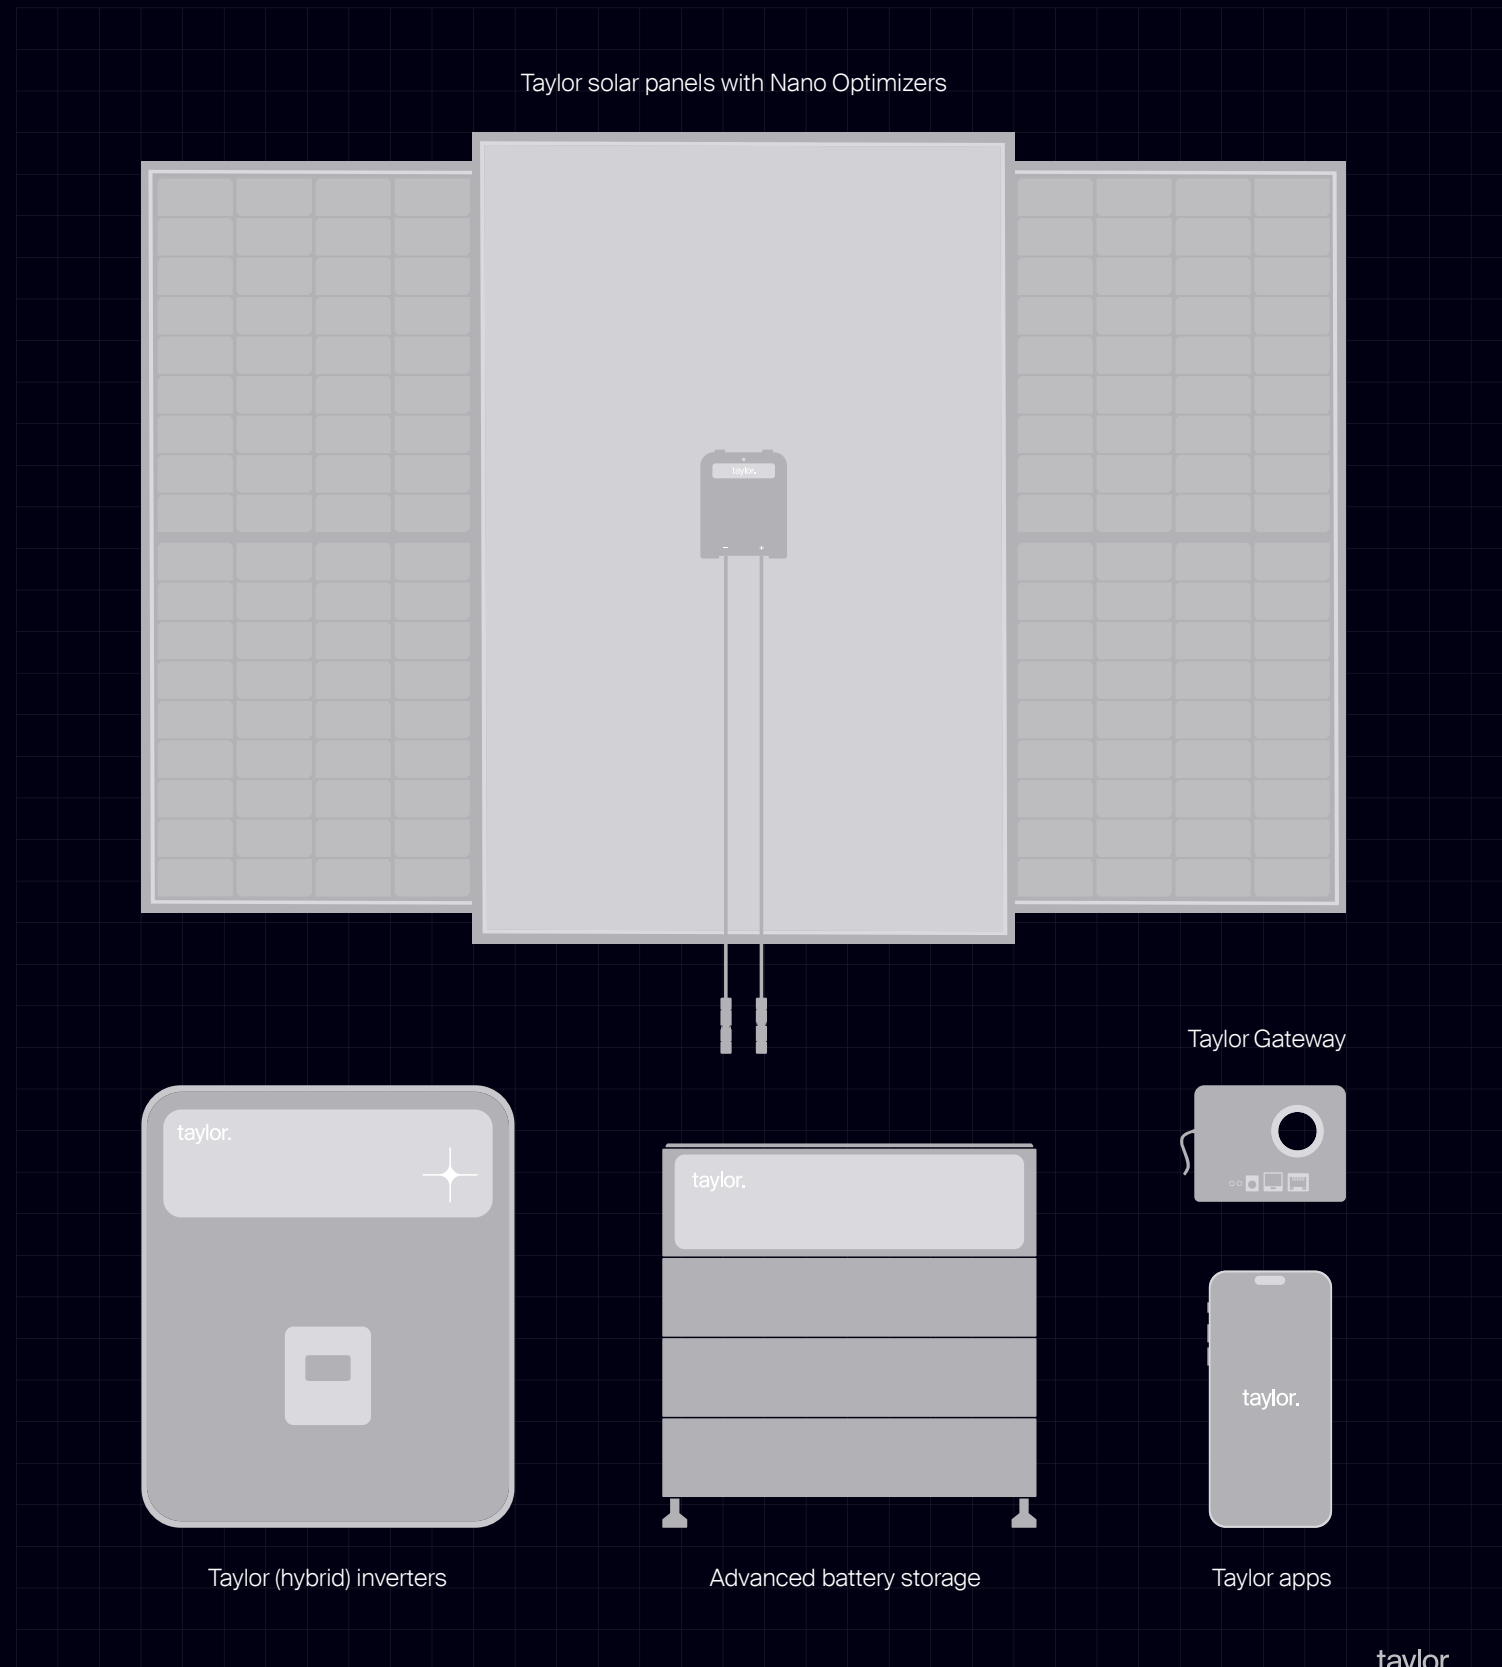

One complete energy system from Taylor.
Smartly engineered, reliably delivered, locally supported.

one brand, all solutions.

More and more customers want one party to decarbonise their entire energy system. With Taylor you offer that in one go: solar panels with Nano Optimizers, inverters, batteries and smart control via the Open energy manager. No loose brands, no fiddly integrations. Just one system that works. And you remain the main point of contact.

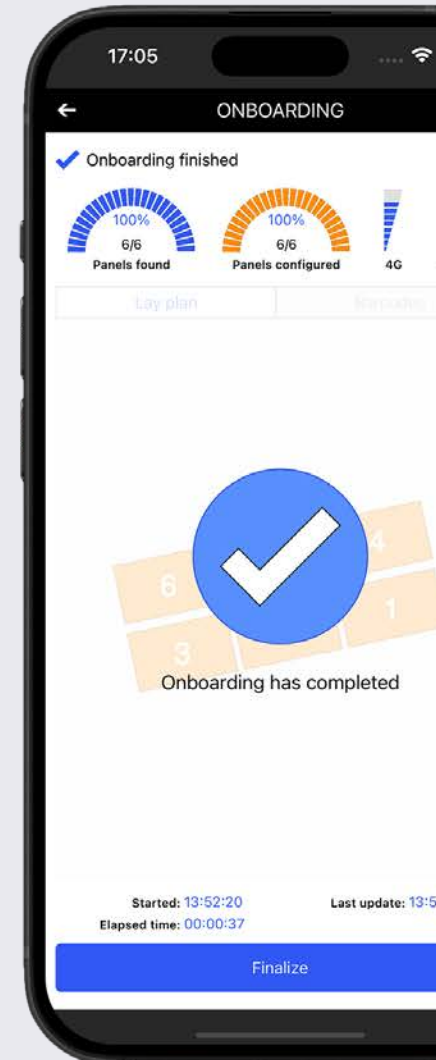

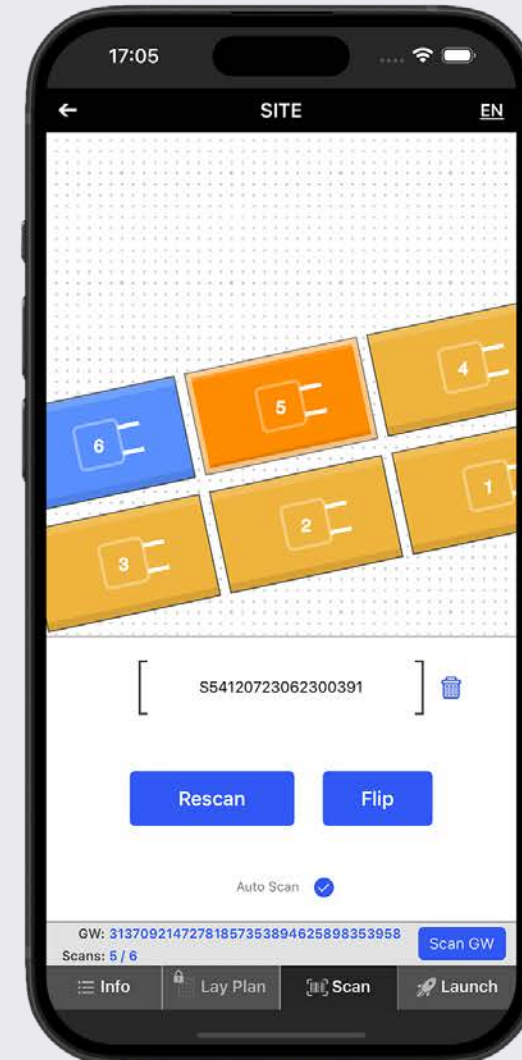

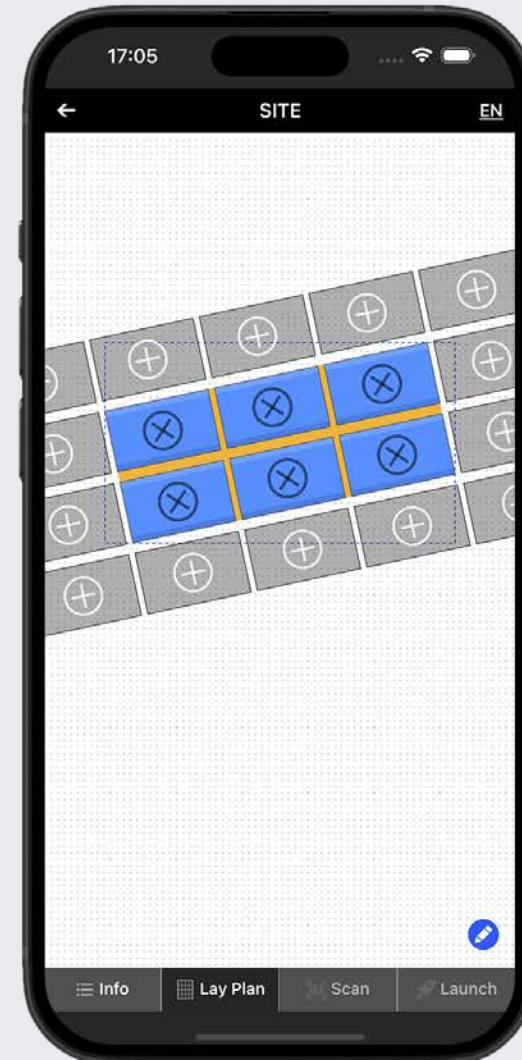

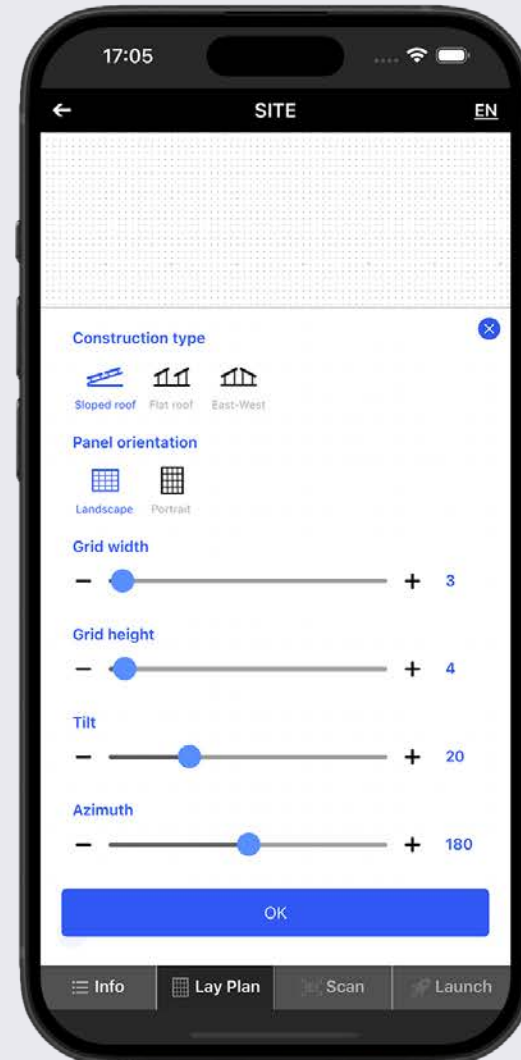

take control of your energy.

less work, fewer errors.

Taylor hardware & software is designed with installers, for installers. With 50% fewer connectors than microinverters or optimizers, it's faster and less error-prone. After completion you get instant on-site feedback. Taylor tools help with your layout and during installation. You save time both on the roof and in preparation.

happy customers, zero hassle.

Fewer faults mean less work for you and less frustration for your customer. If something does go wrong, you automatically get a system alert. You can often resolve the issue remotely on the spot. Those are stories they'll tell their neighbours...

no lock-ins, full flexibility.

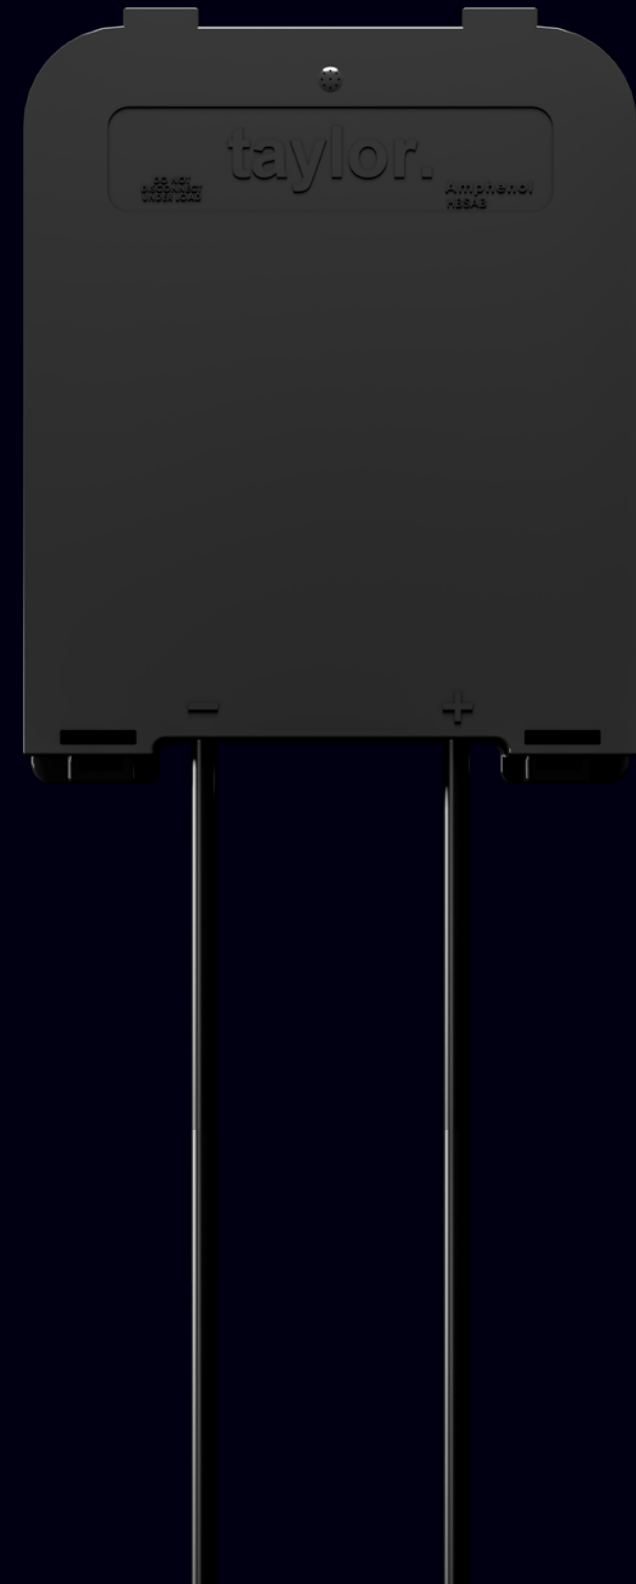

Taylor isn't a closed system. Your customers choose their own energy supplier and can later add EV chargers or heat pumps from other brands. The Open energy manager controls those devices automatically. Do they already have solar panels? You can still help—e.g. by adding a Taylor inverter and battery. That way you give customers the freedom to grow with you, without locking yourself into one supplier or platform.

more value, without more work.

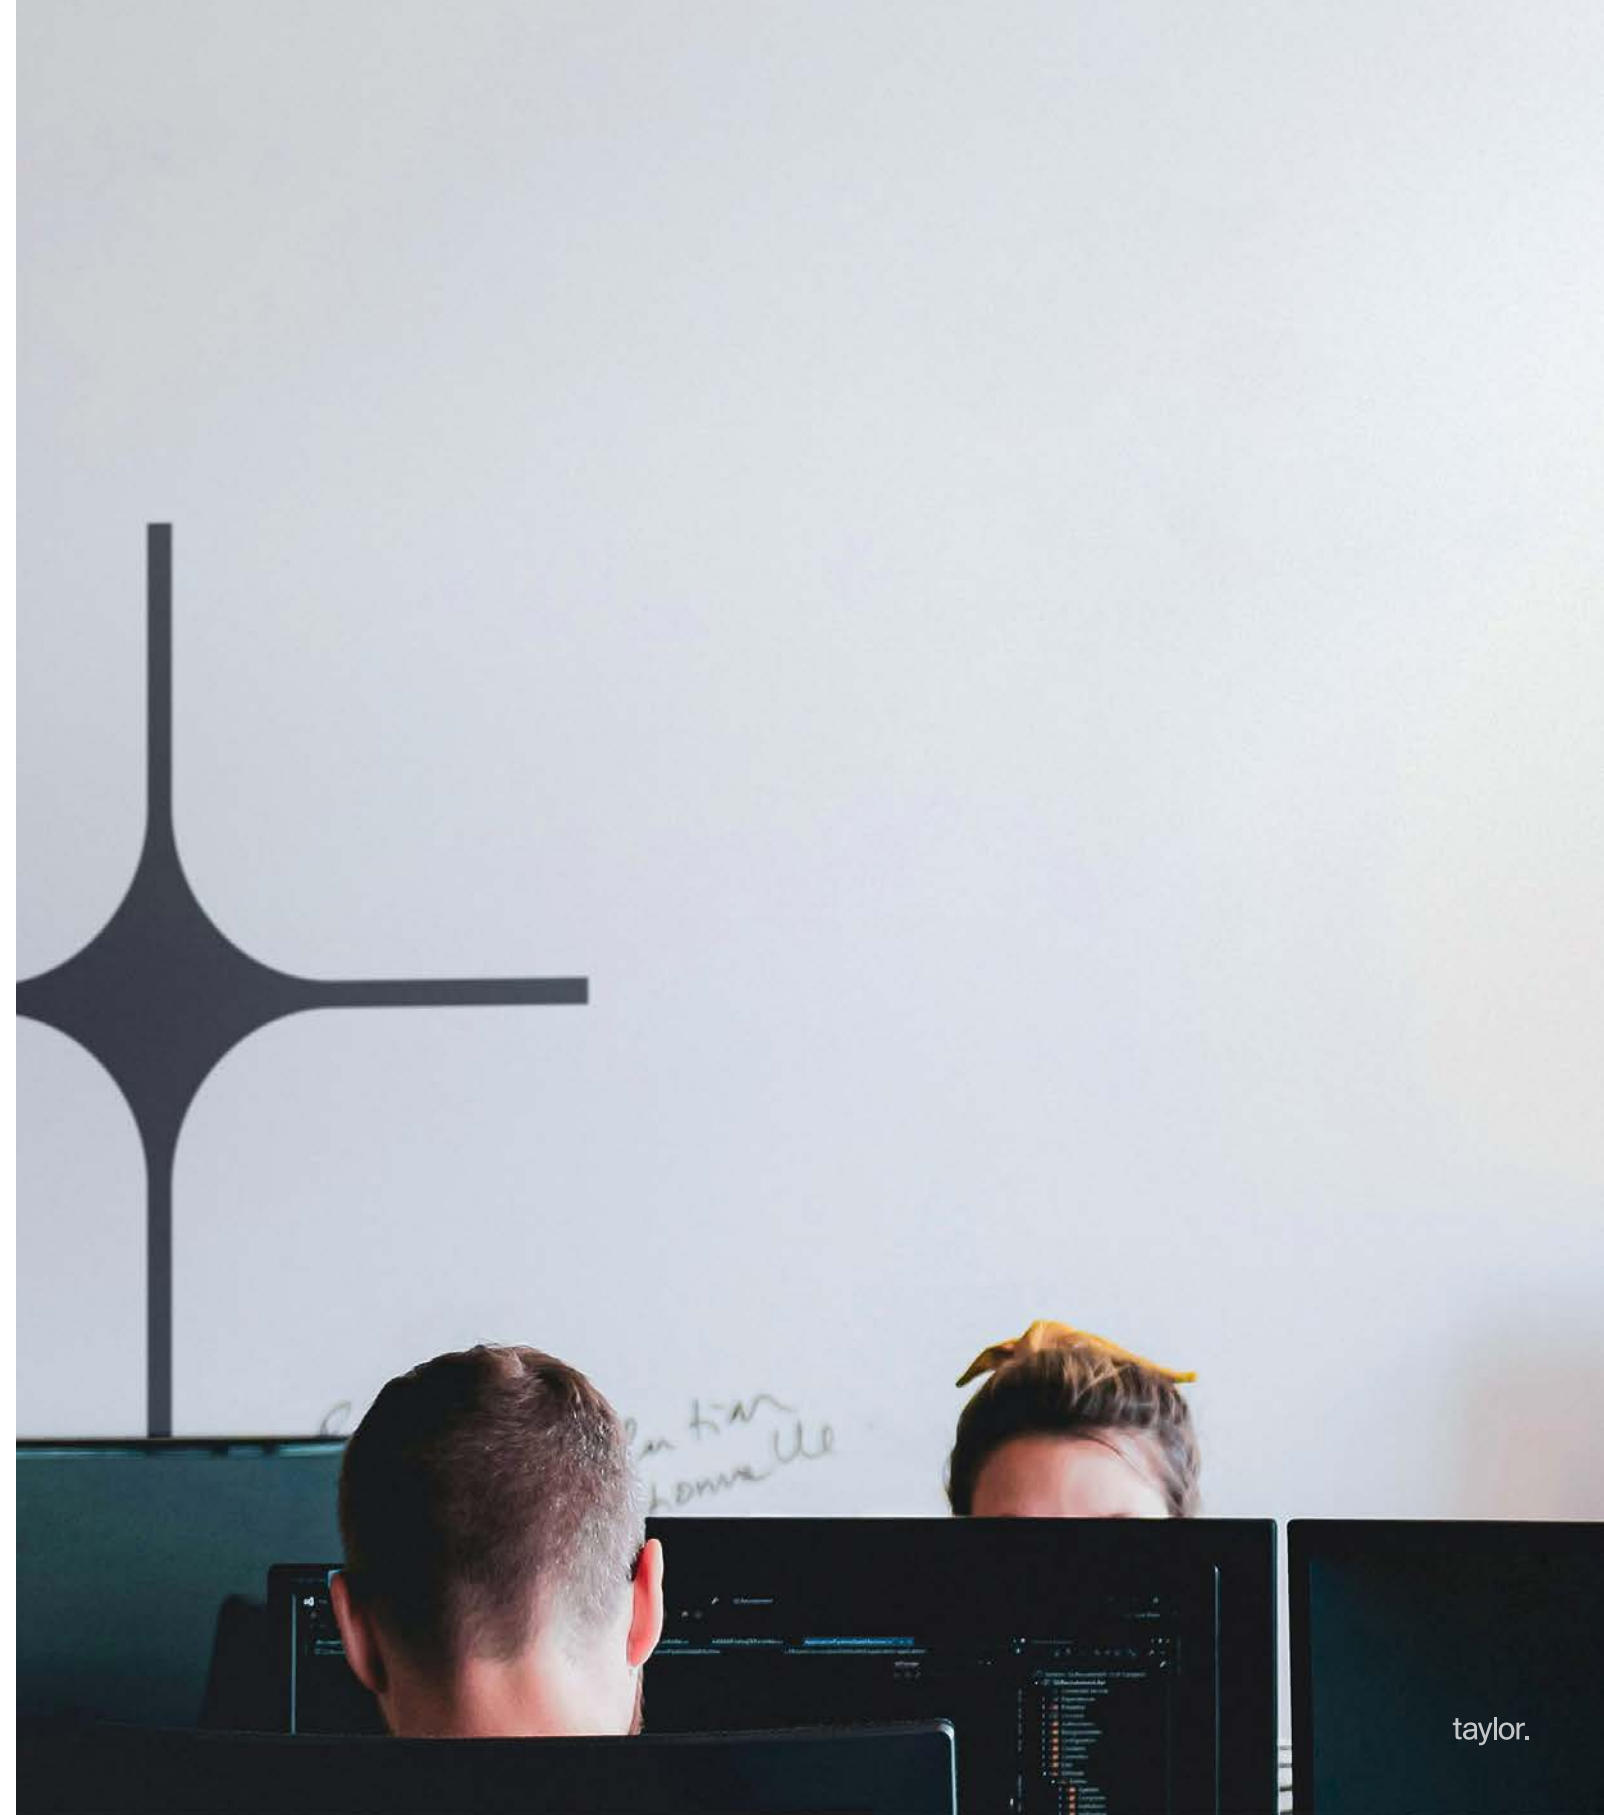

Taylor's Nano Optimizers are already integrated into the panels. So you deliver an advanced system with higher yield—but without loose optimizers or extra installation work. That keeps your costs low and your margin healthy, while your customer gets more than with the usual alternatives.

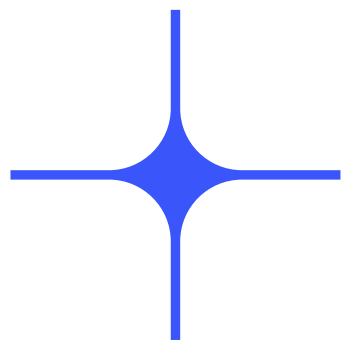

Dutch support, short lines of communication.

A flawless installation is key to serving your customer well. And a first installation with a new brand deserves a little extra attention. That's why we're happy to be on-site with you, or train you beforehand. Need support later? You'll get a support engineer from our own team on the line. No queues, no middlemen. Because we develop and support everything in the Netherlands, we can move fast.
