DATABAHN

IN-STREAM DETECTIONS DEEP DIVE

Quick Signals

Don't wait 40 minutes to stop a threat

Up to 90% lower mean time to detect

Most detections run after the data has been routed, indexed, and correlated in the SIEM. A stolen credential signs in, the events travel downstream, and an alert appears 30 to 40 minutes later. By then the account has had plenty of time to do damage.

Quick Signals removes that wait. It runs your deterministic detection rules on events as they move through DataBahn, and fires a signal with user and asset context the moment a rule matches. Alerts that normally wait on routing, indexing, and correlation fire in the first minute.

Single-event rules

Flag a condition on a single event, like a privilege change.

Lookups and watch lists

Check events against lookup tables and executive watch lists.

Aggregations

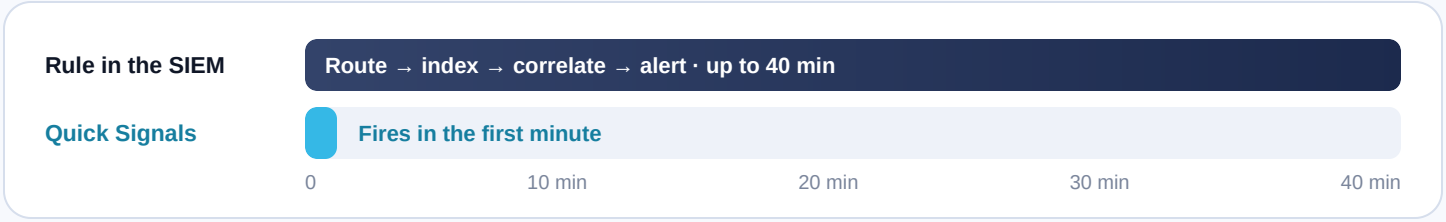

Catch patterns like 5 failed logins followed by a success.

Straight to response

Send context-rich signals to your SOAR and to Lumen, DataBahn's investigation agent.

How long does your SIEM take to notice?

Every deterministic rule pays the wait for indexing and correlation, which can run up to 40 minutes. Each follows fixed logic, so none of them needs a SIEM's analytics engine to fire.

DETECT IN THE FIRST MINUTE

Fires the moment a rule matches

Quick Signals checks events as they pass through DataBahn and fires in the first minute when a rule matches, such as an email to a competitor's domain.

Runs every deterministic rule

Deterministic rules account for up to 80% of SIEM alerts, and Quick Signals runs all of them in the stream. A global commercial real estate company gets every detection its SIEM rules would have produced.

Works alongside your SIEM

Clean, transformed, and enriched data still routes to the SIEM, so correlation and analytics there carry on as before. Quick Signals adds an earlier first alert.

See it on your own data

Schedule a personalized demo and we'll walk through a quick signal firing on your own telemetry, so you can see the timing for yourself.
