1. Bader Medical Institute of London, Marylebone, London, United Kingdom

Presented at IMCAS annual world congress in Paris: January 30, 2020

### HIGHLIGHTS

- HIFEM procedure **enhanced the sexual function** of all (N=15) treated women.
- PISQ-12 score showed **significant** improvement by **5.8 points** (+19%;  $P<0.001$ ).
- The **greatest change** was observed in partner-related domain (**+3.3 points**,  $P<0.001$ ).
- Subjects reported more intense and frequent orgasm along with greater sexual desire and excitement.
- The subjects with lower PISQ scores at the baseline benefited most from the treatment.

Mean PISQ-12 score before and after the treatments divided according to the domains. Improvement was found to be statistically significant in each domain ( $P<0.05$ ).
