## WHAT IS SPC FLOORING?

Nano Carbon SPC Flooring is an innovative type of flooring that combines SPC (Stone Plastic Composite) with nanocarbon technology. The SPC flooring substrate is made from limestone powder, polyvinyl chloride (PVC), stabilizers, and other components, offering properties such as water resistance, moisture resistance, wear resistance, and environmental friendliness. Through nanocarbon technology, the surface is treated to form a hard protective layer that further enhances the floor's hardness, abrasion resistance, and stain resistance.

Nano Carbon SPC floors combine benefits such as high durability, abrasion resistance, stain resistance, water-proof properties, eco-friendliness, and easy installation, making them suitable for a wide range of environments.

### Structure of Nano Carbon SPC

# Material & Construction

## SPC Core

Limestone powder + PVC (without plasticizer)

## Nano Carbon coating

For increased scratch resistance and fire resistance

## UV protection layer

Against fading

## Prefabricated kick plates

Optional, for more comfort & sound instalation.
