Strategy description

The Gold Arbitrage Fund aims for an annual net return of 10% to 15%, after deduction of all costs.

Market-neutral profit from price differences Market-neutral investing focuses on generating returns without depending on rising or falling markets. By simultaneously taking opposite positions – for example, going long in one instrument and short in another – market risk is minimized. The goal is to profit from price differences or inefficiencies, regardless of the overall market sentiment. This approach offers investors a stable, defensive strategy that proves its value especially in volatile market conditions.

Two complementary arbitrage strategies At the core of our approach are two forms of arbitrage: statistical arbitrage and interest rate arbitrage. Statistical arbitrage involves analyzing historical price relationships and mean-reversion patterns to identify temporary market inefficiencies. Interest rate arbitrage focuses on exploiting differences in rollover costs, particularly within the spot market. By combining these strategies in a controlled manner, the fund capitalizes on opportunities between the gold spot price and gold futures price, as well as on differences in rollover costs between liquidity providers, without taking a directional view.

Return without exposure to market risk A key principle of the fund is the complete avoidance of market and price risk. By carefully hedging each position, a robust, market-neutral return is generated, independent of economic cycles or geopolitical tensions. The strategy is supported by advanced technology and real-time data processing, enabling arbitrage opportunities to be captured quickly and efficiently. Strict risk management and a strong focus on capital preservation form the foundation of this approach. In this way, the fund delivers a stable return even in volatile or uncertain market conditions – purely based on rational arbitrage within the gold market.
