

Enhanced Cycle Counting

Built on Certinia's Inventory Management Solution

Modernize your inventory reconciliation

Ladd Partners' Enhanced Cycle Counting solution modernizes inventory reconciliation by integrating seamlessly with Certinia Inventory Management. Our extension replaces manual, paper-based processes with a smarter, faster, and more accurate way to perform cycle counts. Designed for scalability and ease of use, it supports high-volume warehouses while giving managers the tools they need to track, assign, and confirm counts with confidence.

From Count to Close. Inventory that reconciles itself

Once a cycle count is initiated, the system automatically creates detailed count records based on the selected warehouse, location, or item. Managers can assign counts to team members and monitor progress in real-time. Team members use the Salesforce mobile app to enter quantities on the go, with support for blind counts and multi-location tracking. When counts are complete, Certinia generates inventory transactions to highlight discrepancies and posts the financial adjustments directly to the general ledger — ensuring accurate reporting and complete traceability.

Count faster with confidence

Enhanced Cycle Counting gives your team a faster, paperless way to manage inventory accuracy and reduce risk across your operations. With real-time visibility, fewer manual steps, and better alignment to accounting, your business can operate with confidence. Ladd Partners brings deep Certinia expertise, hands-on support, and practical implementation experience to help you deploy this solution smoothly and see results quickly. We don't just deliver software — we deliver success, backed by proven customer stories.

KEY FEATURES:

- Create and manage Cycle Counts by warehouse, location, or ABC classification
- Blind counts supported, with manager override for accuracy and control
- Paperless mobile data entry, directly through Salesforce Mobile
- Automated variance reports before adjustments are made
- Supports both serialized and non-serialized inventory
