

Test with precision, treat with confidence.

Drug Response Testing for Multiple Myeloma

PrevisionOne™

Patented ex vivo drug testing platform

Find the right treatment for your Multiple Myeloma patient - faster.

In Multiple Myeloma, treatment decisions are increasingly complex, with a growing number of therapeutic options and combinations available across different lines of care. Yet, selecting the most effective therapy for an individual patient remains a major clinical challenge.

PrevisionOne™ addresses this gap by providing a clinical decision support tool using **functional, patient-specific drug response data**, generated directly from **live cancer cells** - enabling oncologists to make faster, more informed treatment decisions.

-  Evaluate standard-of-care and advanced therapies & **identify optimal combinations**
-  **Reduce trial-and-error** prescribing, support decisions in relapsed/refractory settings
-  Select treatments with **higher likelihood of response**, avoid ineffective therapies and unnecessary toxicity

The science: Award-winning technology Pharmacoscopia

The clinically most validated functional precision medicine method which uses image-based single-cell data to evaluate ex vivo patient drug responses.

Studies published in [Nature Cancer](#).
Developed in collaboration with

 **INSELSPITAL**
UNIVERSITÄTSSPITAL BERN
HÔPITAL UNIVERSITAIRE DE BERNE

USZ **Universitäts Spital Zürich**

What we do:

Test primary patient biopsies
Analyze single cells
Deliver functional and rapid drug response data
Provide precise actionable insights

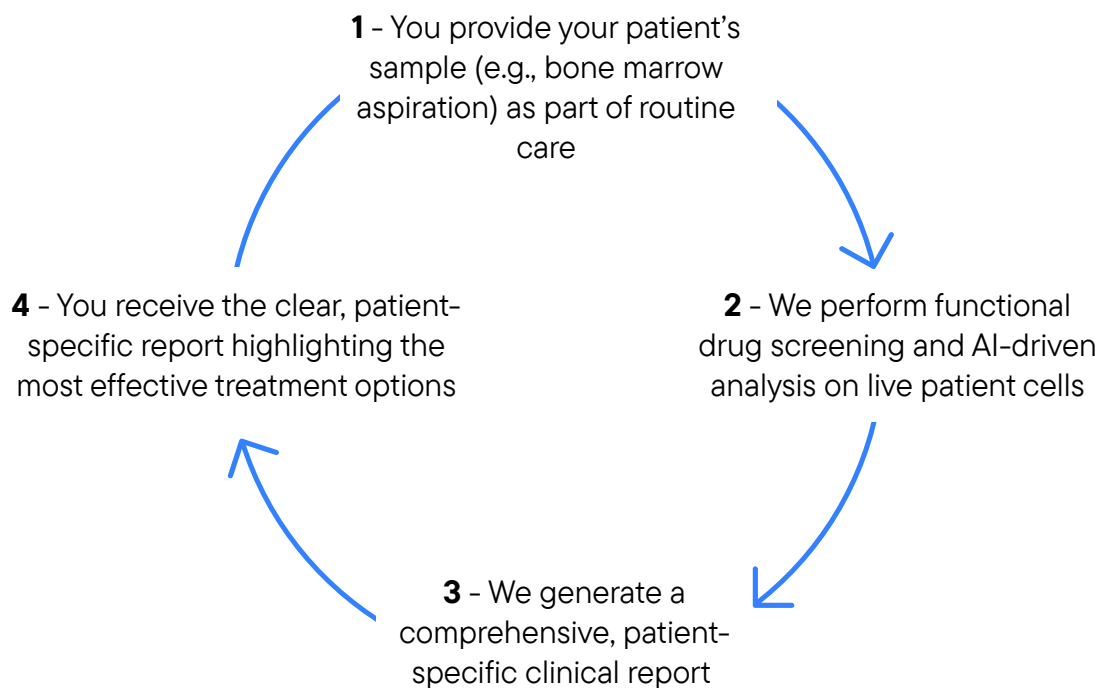

What we don't do:

No genomic-only predictions
No animal models
No artificial cell lines

Multiple Myeloma Drug Screening Test

Using our proprietary **PrevisionOne™** platform: our RUO test provides a patient specific report that reveals which treatments are most effective - testing >50 drugs and drug combinations for actionable results within 72 hours.
