

BODHI
TULUM

The term **BODHI** comes from Sanskrit, and means to awaken, to understand.
This project seeks to accompany this awakening by reconnecting us with our primary environment: **Nature**.

41 residences of 1 to 3 bedrooms surrounded by vegetation. The towers are designed and distributed to work in synergy with the wind, water and light provided by the jungle. The construction respects the materials and finishes of the area, creating a blend between the vernacular and the contemporary. Each unit is designed for privacy, exclusivity and comfort with completely green views.

41 units on
10.000m² of land

Sustainable
development

Exclusivity and
privacy

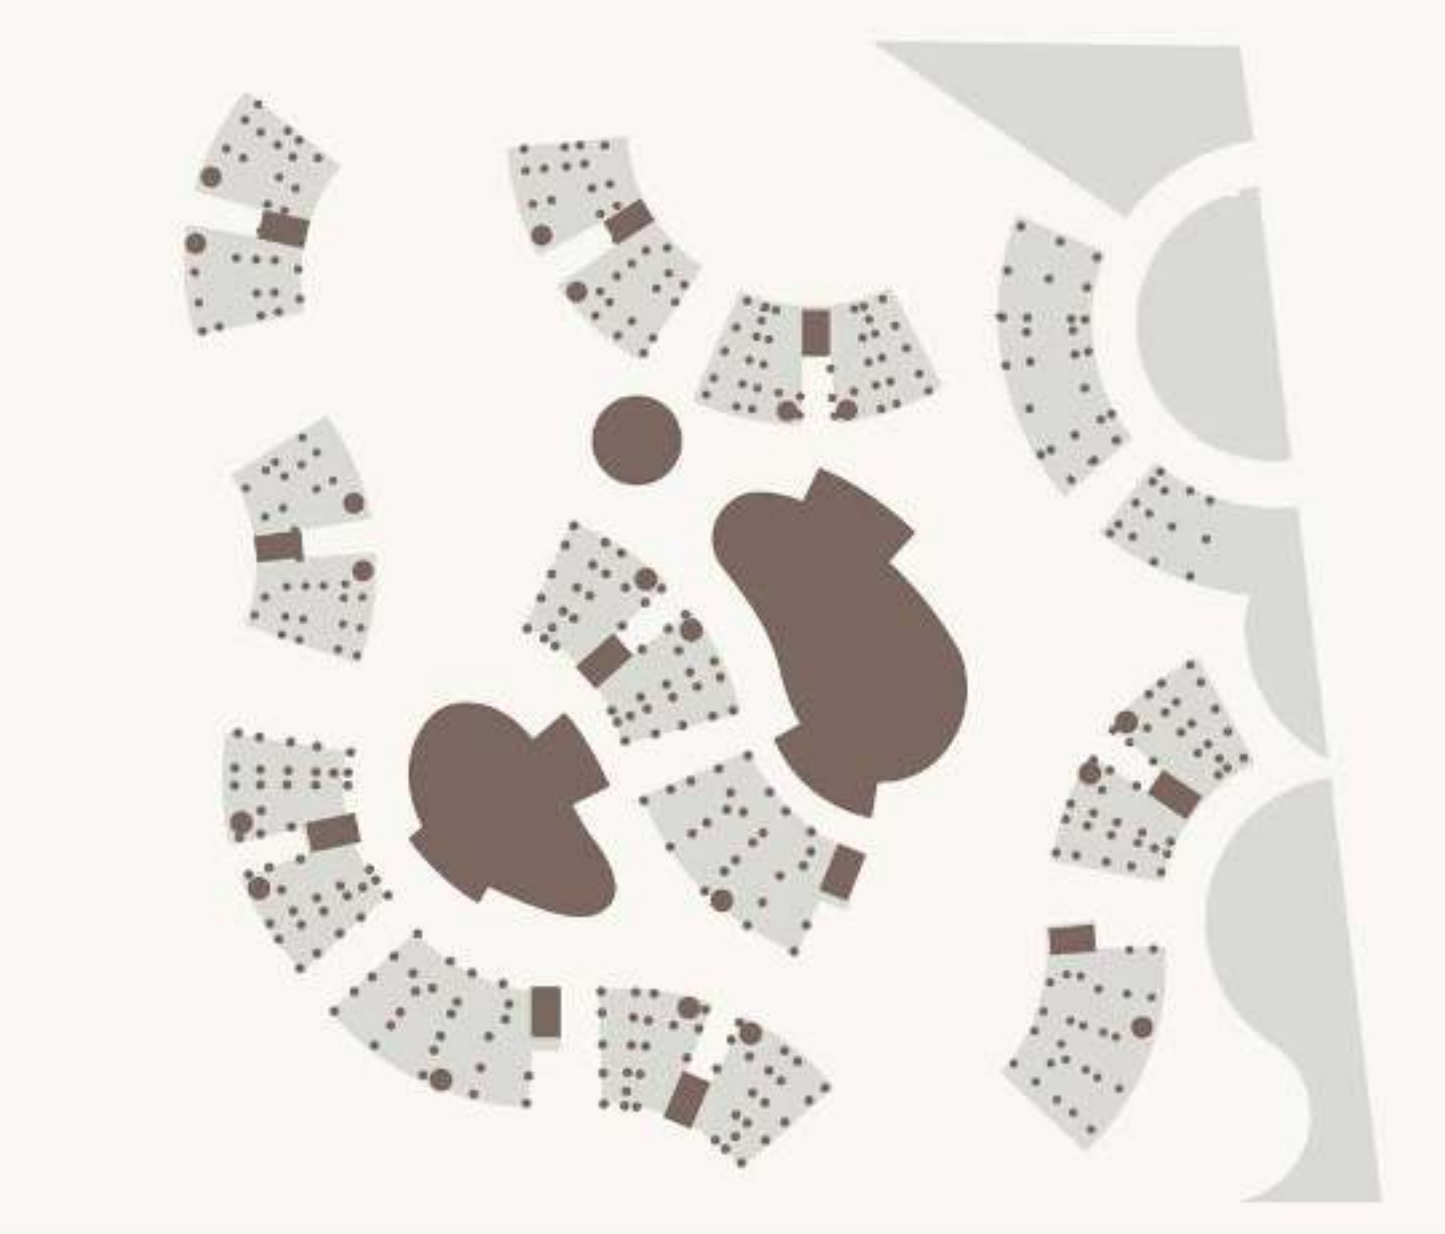

Bioclimatic design

Embracing Nature's Breath: Experience the tranquility of a **low-density** project rooted in soil respect.

The complex houses 41 units on 10,000 m² of land, preserving almost 70% of the natural green areas.

The entire construction is founded on piles, affecting the permeability of the soil by only 13%. This allows for the absorption of rainwater, the free flow of animals and the growth of tree and plant roots. All this provides better climatic and thermal conditions for the users.

■ Total non-permeable area: 1,353 m²

Transforming real estate & empowering change: Our commitment to a **sustainable tomorrow**

Bioclimatic design | The project takes into account the local climate and seeks to make the most of natural lighting and ventilation, favoring comfort and reducing energy consumption.

Rainwater harvesting | Each tower has roofs specially designed to capture and collect rainwater, which will be used for the irrigation system in times of drought. In this way, the use of natural resources is optimized and the consumption of drinking water is reduced.

Solar energy | All towers are equipped with solar panels, reducing the consumption of each unit.

Chemical-free pools. | Both pools are equipped with a physical and biological filtering system, avoiding chemical contamination released by chlorination systems. This reduces maintenance costs and helps to preserve the natural balance of the environment and its users.

Double-glazed windows | The units are fitted with dual glazing, which provides greater thermal and acoustic insulation, offering freshness and comfort in the interiors, as well as energy savings.

Water treatment | The complex has wastewater treatment, providing a dual use for the project's water and preventing subsoil contamination of the world's largest underwater cavern system.

Organic waste treatment | The complex will have an organic waste composting system, ideal for turning our waste into food for the green areas.

Rediscover tranquility in our meticulously designed units.

Chukum Walls

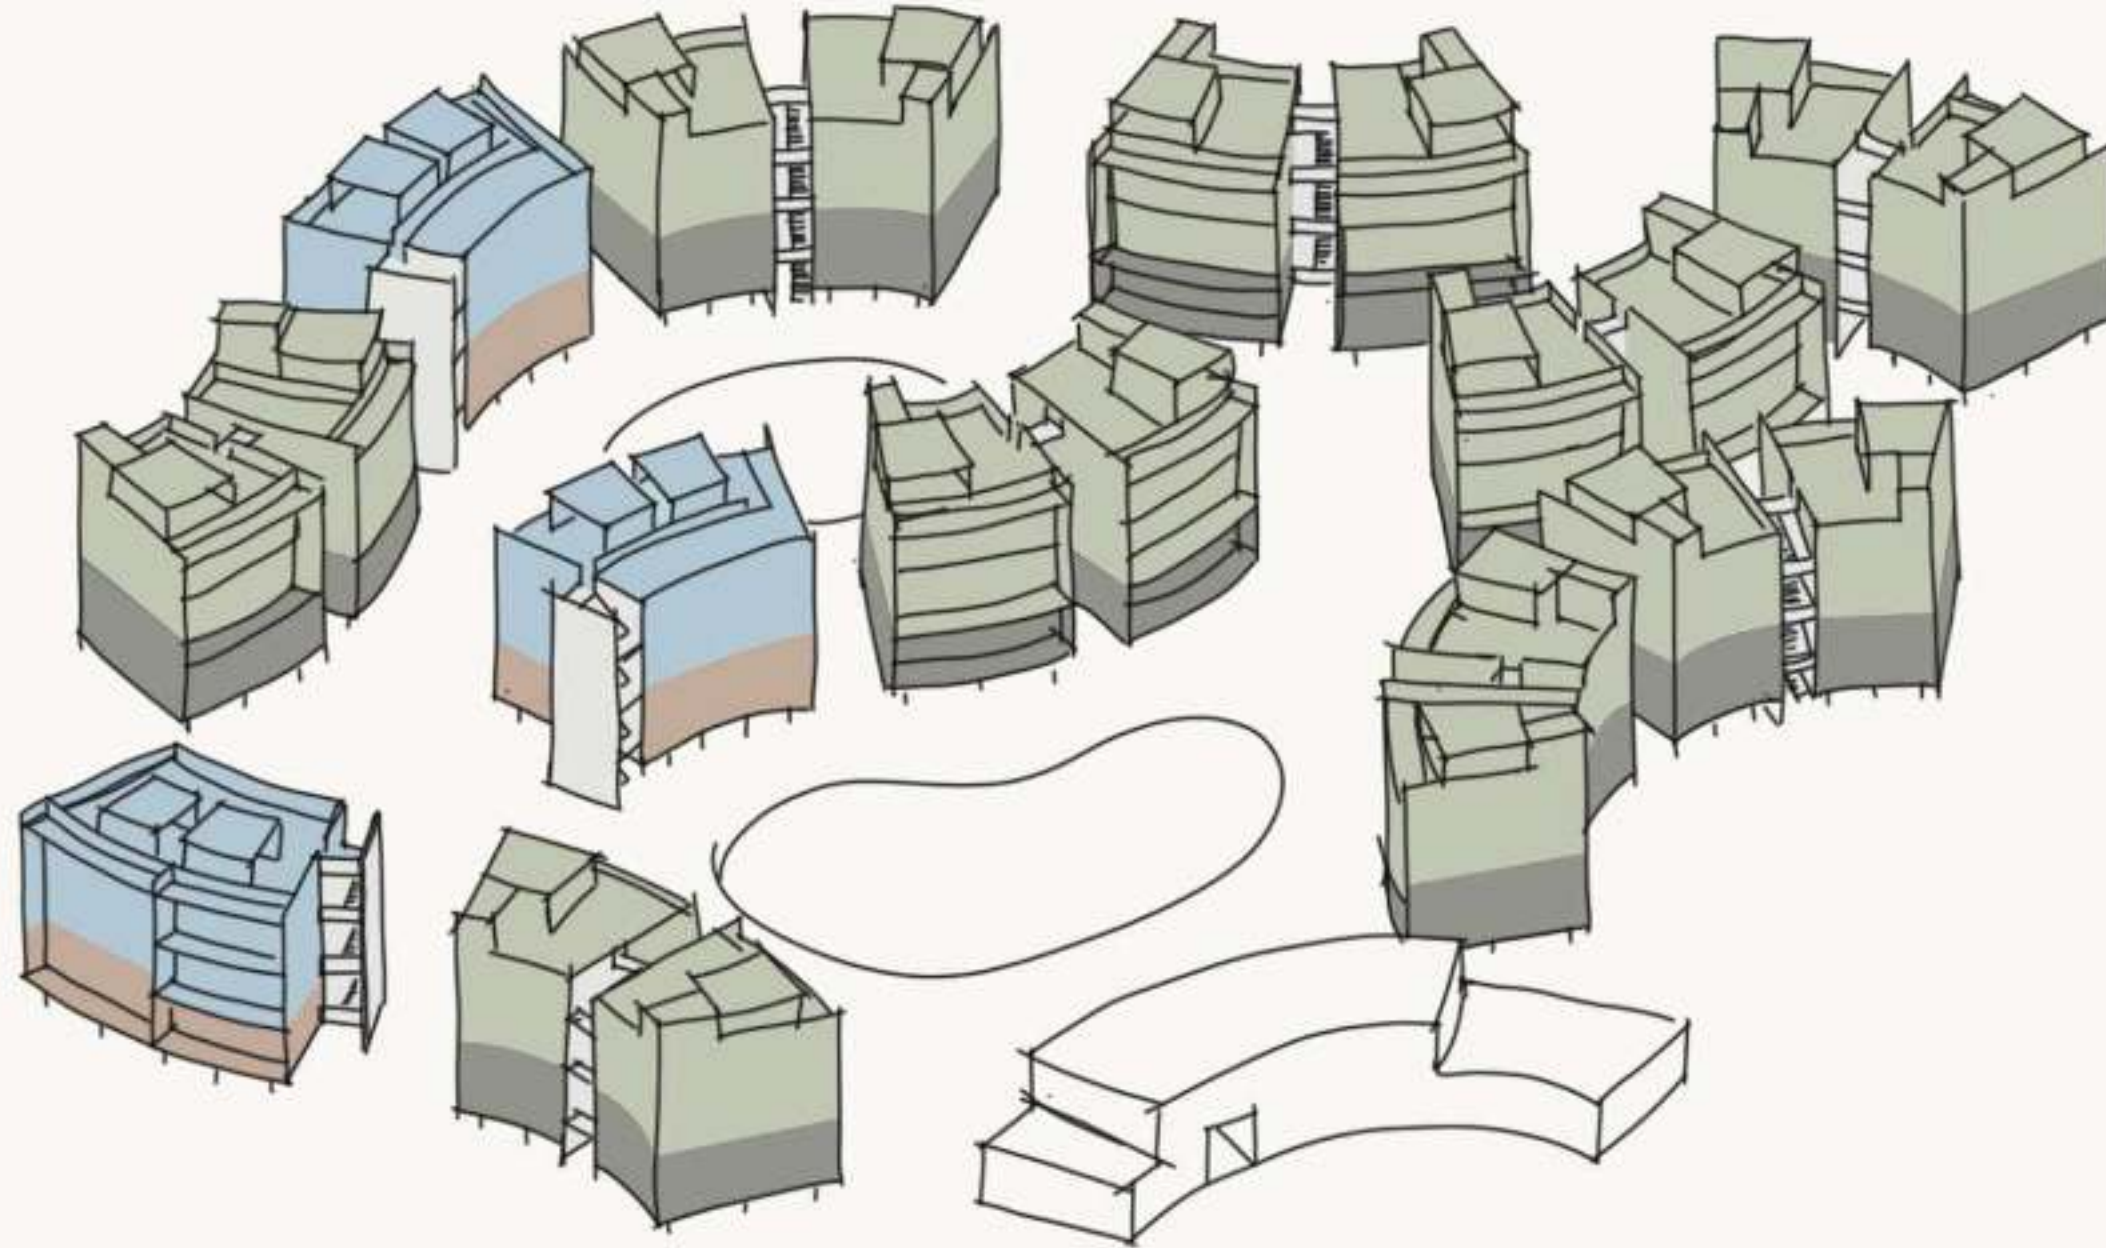

Floor-to-ceiling windows with double glazing, ensuring acoustic insulation

Independent walls that guarantee the privacy and tranquility of the users in each unit.

Each unit has its own **Jacuzzi** with Sukabumi and black lava finishes.
