

Smart Continual Cybersecurity
Assessment (SCCA)

Introduction Pack

Contents

Background	3
The Problem	4
Attacker Mindset	4-5
SCCA	6-7
Benefits	8-9
Reporting	8

The Problem.

Attackers extensively use bots and AI tools to find vulnerabilities.

- They are scanning ALL your infrastructure - and likely you're under constant low grade reconnaissance attacks constantly.
- Once they find a vulnerability, other bots take over and exploit the weakness.
- They often find just the smallest vulnerabilities to exploit over time with much larger coordinated attacks.
- Periodic Pen-testing leaves gaps.
- GenAI and malicious bots are changing the attack vectors

The Solution.

- VerifiedThreat fights fire with fire to provide an AI based threat vulnerability platform that continually assesses external cybersecurity threats originally developed for governments and sovereign nations.
- Aimed at providing red team state-sponsored level attack simulation on defence, national security and key strategic assets, VerifiedThreat is moving into the corporate market

Smart Continual Cyber Assessment.

1) Discovery

2) Smart Mapping of all assets & partners

3) Smart Monitoring

Major Vulnerabilities

Integrated Risk Register

Continual Improvement

Set & dynamically Apply Policy and auto-remediate

Feedback Loop

AI Intelligent Immunity Layer.

AI Intelligent Layer

Continuous Learning

Feedback loop, machine learning / constant improvement

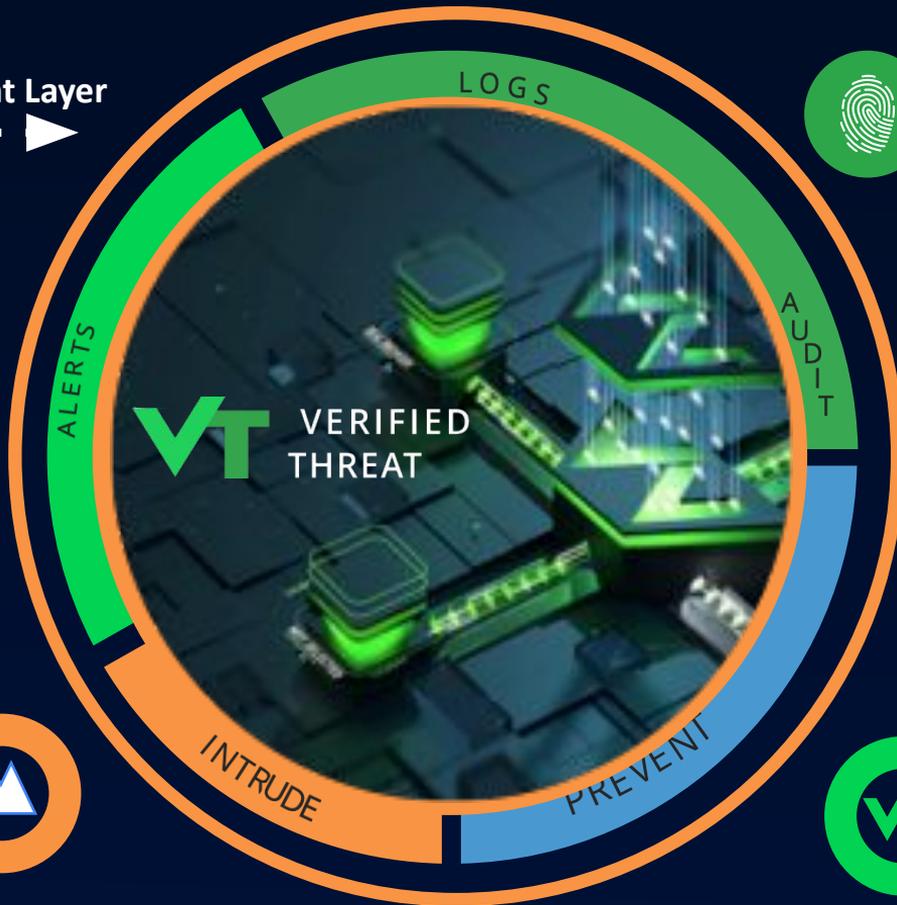

Dynamic Risk Assessment

Red-Team real world risk simulation

Risk Register

Survey the entire risk landscape and creates Risk Register dynamic reporting

Dynamic Logging

Bot agents monitor logs

Threat Simulation

Bot agents continually test for vulnerabilities 24/7

Threat Intel

Specific threat types, local incidents

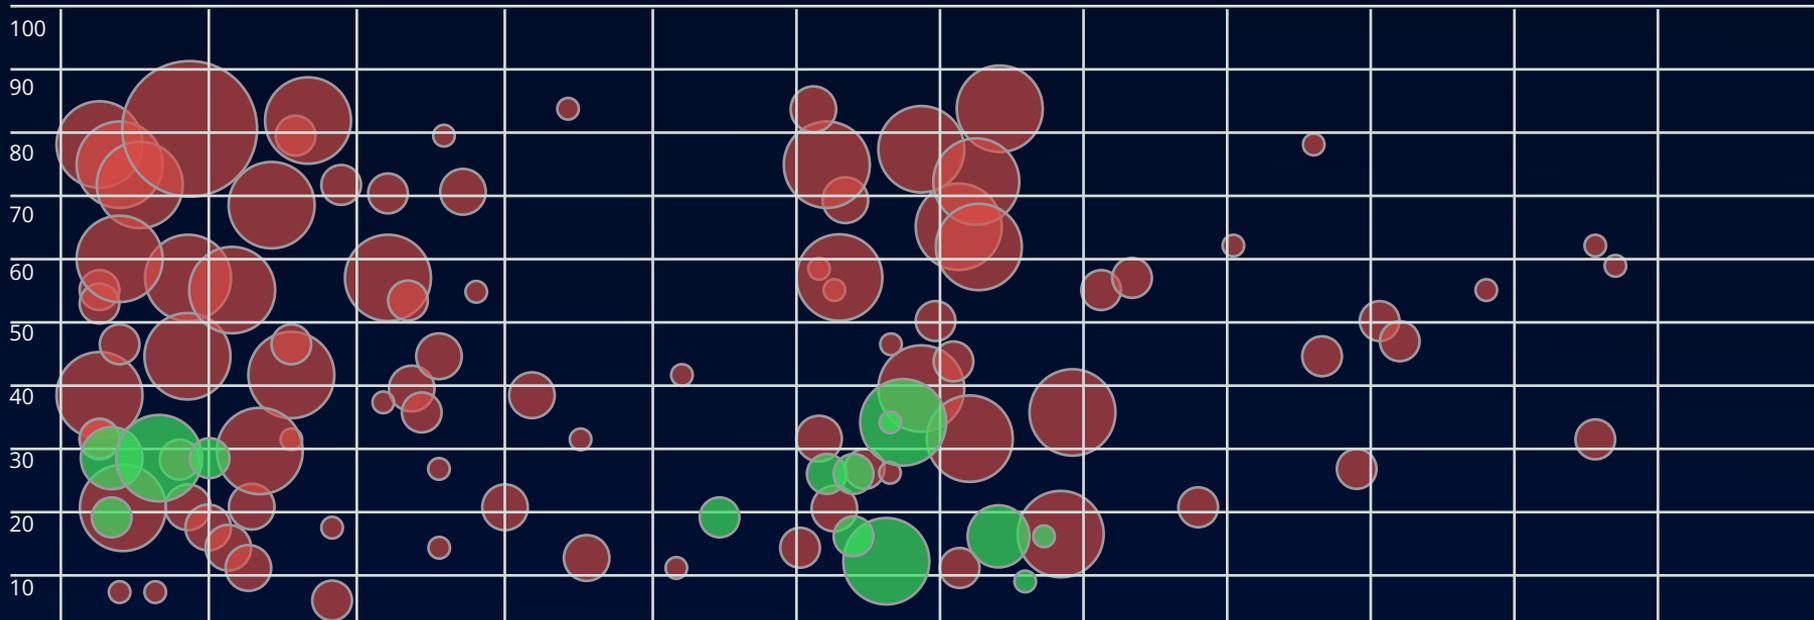

AI Remediation

Live Dynamic Rules are enacted, automatically and validated.

Proven Risk Reduction.

Before VT After VT

Reconnaissance Resource Development Initial Access Execution Persistence Privilege Escalation Defense Evasion Credential Access Discovery Collection Command & Control Lateral Movement Exfiltration

Benefits.

Realtime Comprehensive Threat Maps by Risk

Proactive Prevention massively scaleable for total coverage

- 100% continuous monitoring
- 99% proactive prevention of all Reconnaissance Bots

Now you can measure you can Take Steps to Protect

- Validates and Verifies alerting and from other platforms
- Allows senior leadership to created proper risk based policy

Dynamic Risk Register

Understand and track where the risks are automatically.

- 95% reduction in manual monitoring & overheads
- 100% automated risk register
- Create policy based on risk

Prevention is much Cheaper

- Average data breach costs \$4.8m and \$12Bn annually according to the FBI
- 100% Proactive Prevention
- 99% Detection rate

Identify Vulnerable At Risk Entities and set Policy

Allows you to see the wood from the trees and identify risk

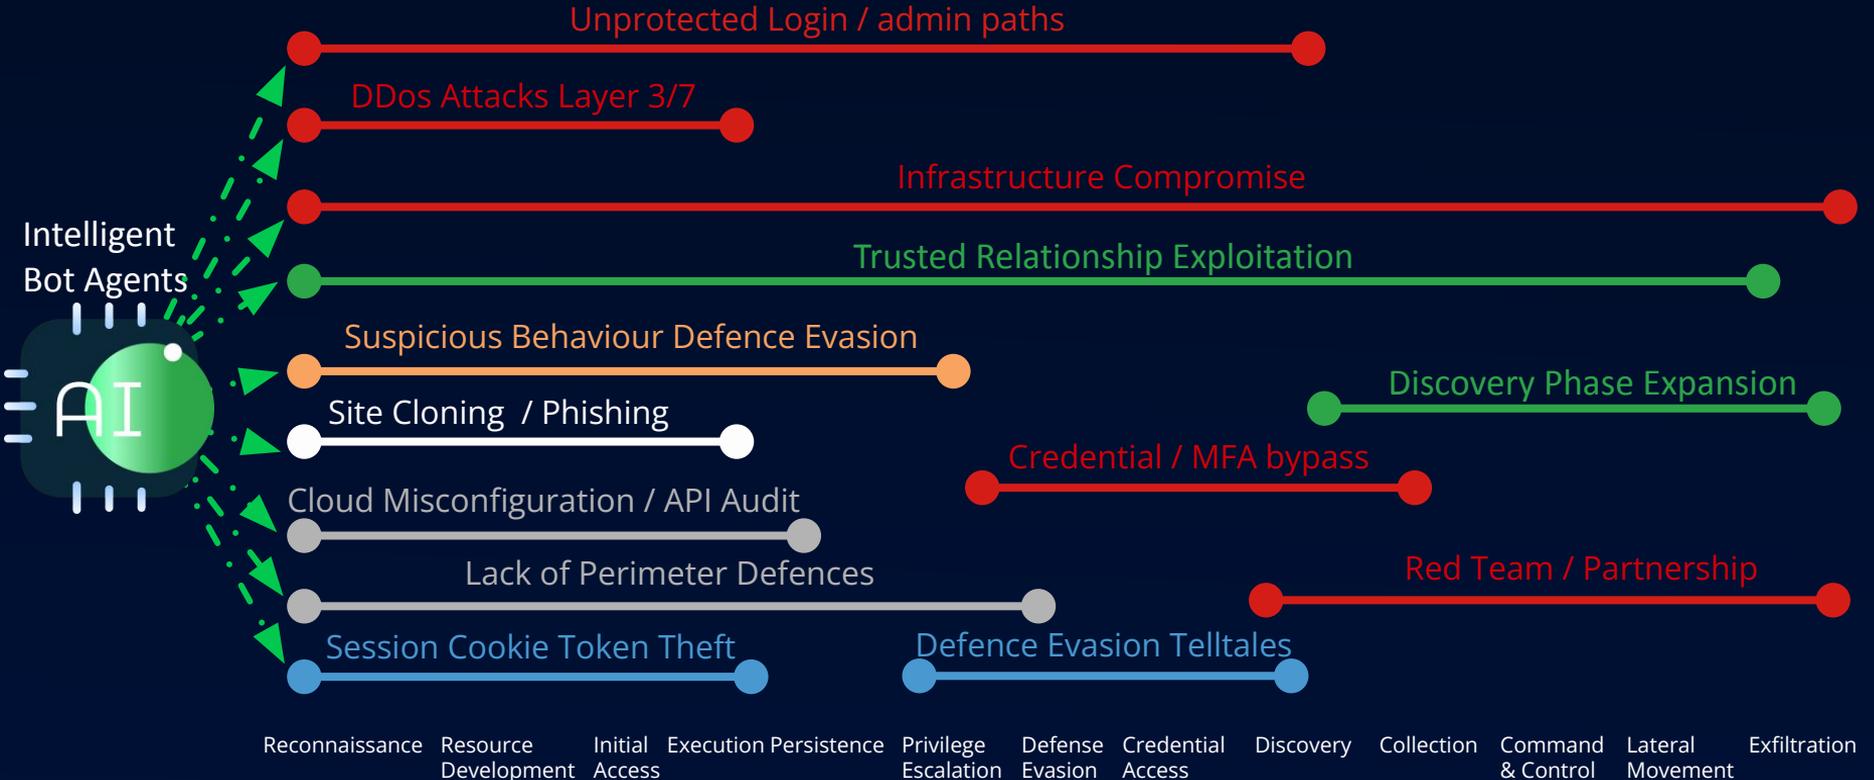

AI-bot agents are working 24/7 365 to identify risks. Penetration tests are often performed annually or quarterly and are manual

Automated Remediation

- 90% remediation is automated and seamless
- 90% reduction in manual monitoring and log checking, WAF rules/ Firewall settings.

SCCA & the Mitre Attack Framework.

Smarter Scaleability for MSPs.

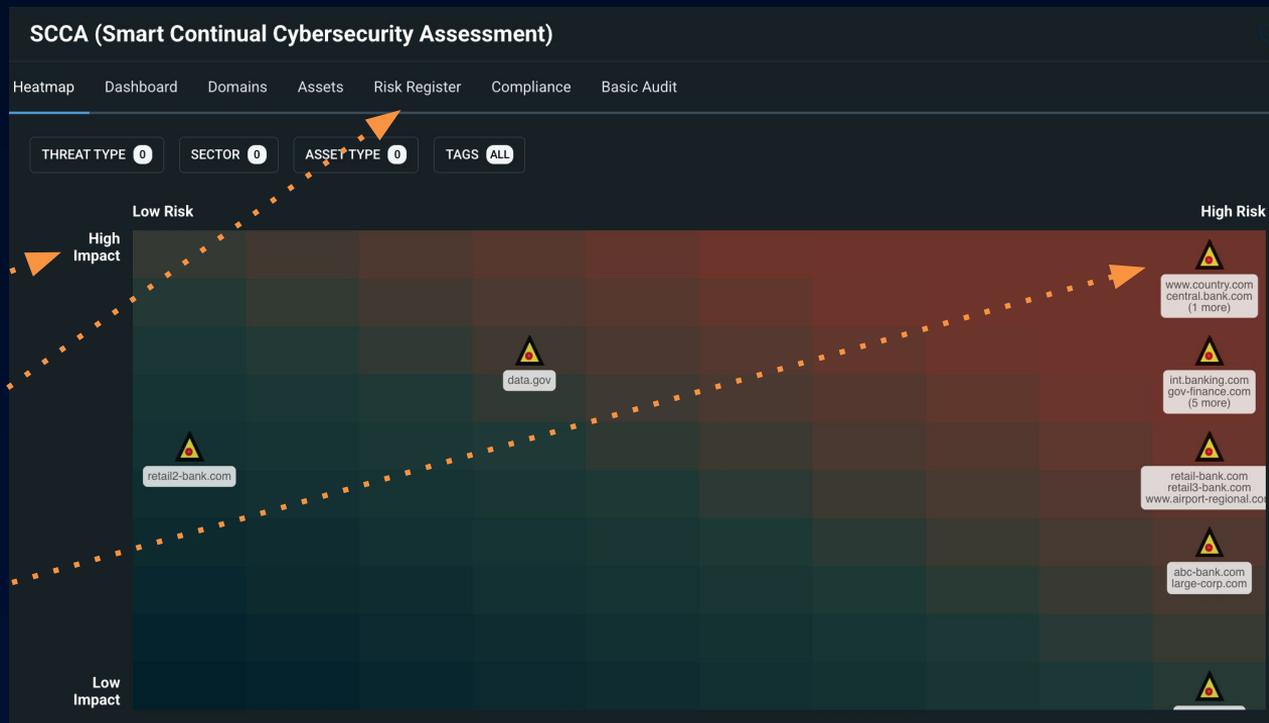

Can Map all clients in the Continual Incident Management Framework

Real-time Dynamic Maps across different threat types by sector and asset type

Massively scalable with automated Risk Register

Shows actual validated Risk across the entire Landscape

Prioritise Low Impact Assets and Risk Accordingly

Consolidate Risk Register.

Automated Central Risk Register

Impact Assessment from threat Level and value of underlying Asset - site cloning, scanning, ATO Residential Proxies

Validates Risk from the actual known threat from the Bot Agents

Add IMPACT for each domain / asset if needed

Audit Existing Tools.

State Before

State After

S

Risk assessment based on historical threat intelligence, not on the entire risk surface area doesn't find the weakest link

Smart Monitoring builds a map of the total risk surface area and the weakest links

C

Scheduled pen testing is periodic, sometimes once a year, or after a major upgrade

Continual automated monitoring detects vulnerabilities or human error in firewall / WAF configs

C

We are constantly buying cybersecurity tools - none of which talk to each other and we can't evaluate true benefits

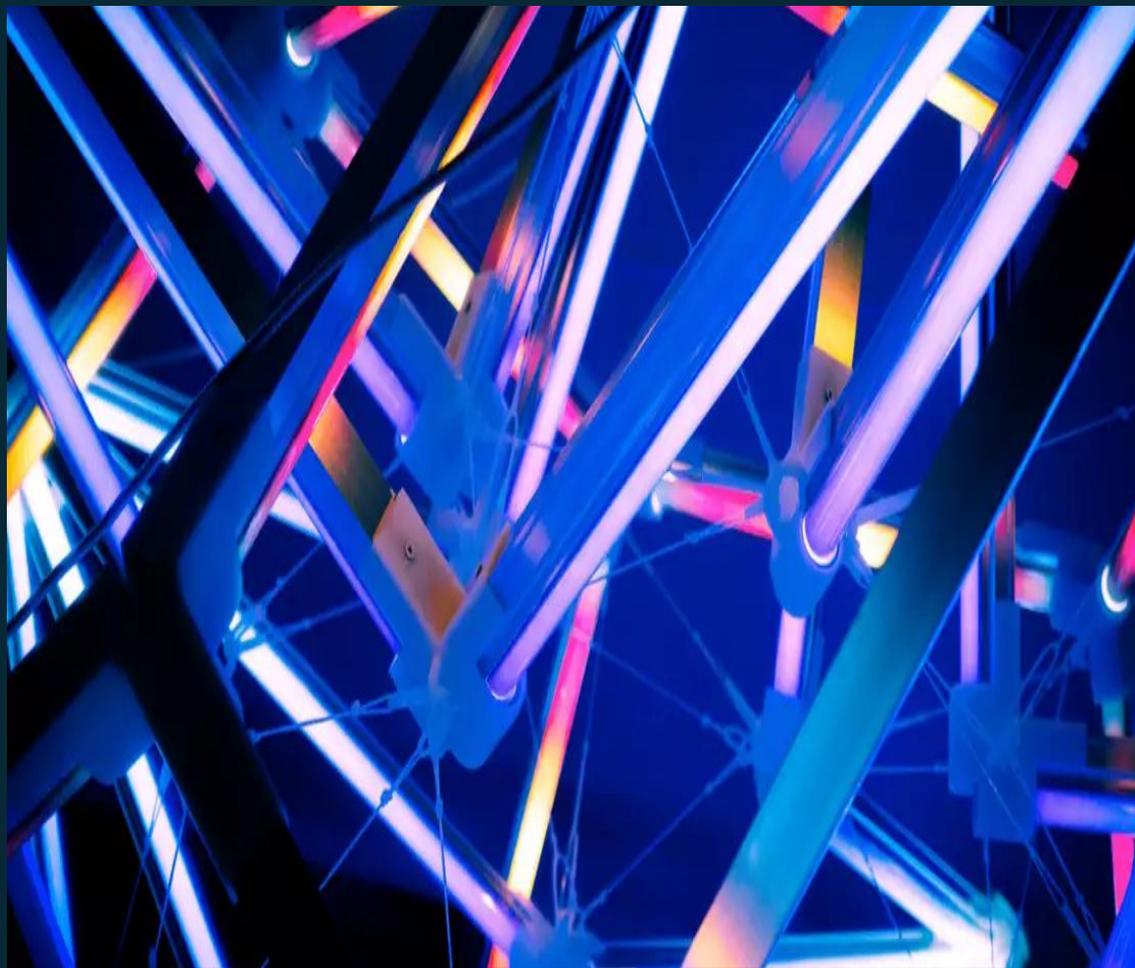

Cyber continual monitoring tests performance of the existing tools and the risk reduction

A

We don't set clear goals as we don't have real risk data. Policy is ad-hoc and based on gut-instincts.

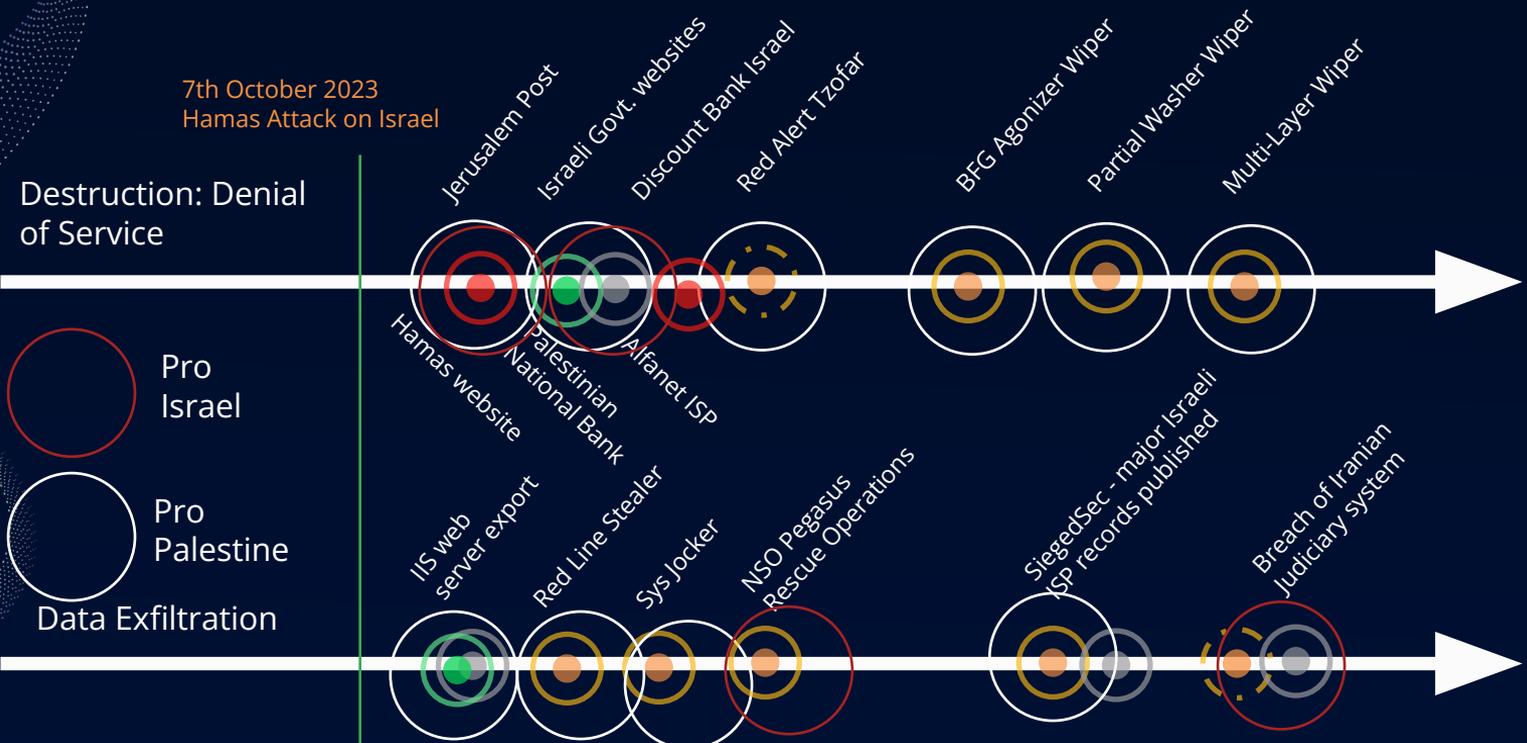

Assessment leads to improved threat decision making, clearer goals and policy objectives KPIs

Appendix.

Anatomy of an Attack.

7th October 2023
 Hamas Attack on Israel

- DDos
- Malware
- Suspected Malware
- Exploitation
- Unknown

Sample Risk Score Matrix.

Sector	Organisation	Root Domain	No. Sub Domains	Bots			National Security Threat Rating		
				Total Deployed	Total Infiltrated	Site Protection (%)	Strategic Sector Rating		Threat Vulnerability Rating
Gov - Level 1 National Security	Ministry of Interior (MOI)	mog.gov	3	30	20	33.33	Tier 1		Level 1 - Critical
