Engineering Team	Andrés Figueiras INOUS Ingeniería integrada
Local engineering	contest 2023 Project 2024-2025
Date	
Renders	Paulino Domínguez

A CORUÑA, SPAIN

Descriptive text

The project resolves the contradiction between the unity of its formal configuration and the diversity of its uses. The parking lot, market, health center, and civic center have completely independent access points. But, at the same time, they share a collective vocation that materializes in the central atrium to which they open, from which they receive natural light and with which they acquire their condition of community public service.

The significant topographical difficulties of the site where the building is located led Manuel Gallego to propose staggered mezzanine levels in the original project in 1979. The strategic placement of the stairs and elevators we propose allows for easy, smooth, and acces-

sible transit between the intermediate floors and the segregation of the building's diverse program. The visual interweaving of uses and circulations around the central atrium that we propose to open transforms into a valuable visual and spatial event for the building, but also, in a certain way, will be the heart of the Santa Lucía neighborhood.

This project is not intended to be a 'modernization' of Gallego's work. Try to extract the most from its original approach, minimizing the impact and modifications on its essential elements while maintaining its light, industrial, and panoptic spirit.
