

CyberForest Shield™

Enterprise Security & Architecture Appendix

Product: CyberForest Shield

Version: SOC v3.3.1 STABLE

Status: Production

Owner: Legal Tech Counsellor by Inna Kragh

CyberForest Shield is an enterprise-grade intellectual property protection layer designed to safeguard proprietary content without interfering with payments, accounting systems, or business-critical data flows.

Core Principles

- Protect IP, never payments
- Never interfere with accounting systems
- Separate UI protection from data flows
- Transparent and audit-friendly by design

Sacred Zones (Explicit Exclusions)

CyberForest Shield never executes on payment flows, invoicing systems, VAT pages, accounting platforms (Visma, Dinero, e-conomic), OAuth callbacks, or partner API endpoints.

Compliance & Audit Readiness

The system provides deterministic behavior, documented exclusions, structured security logging, and audit-ready reporting without relying on obscurity or hidden mechanisms.
