CELSION | BANK

# Custody

Bank-grade custody. Legal segregation. One regulated environment.
Digital asset custody under Liechtenstein banking law - combining legal protection, bank-grade control and integrated operations within one banking setup.

### Asset Protection

Client assets are legally segregated under banking law from Celsion's own estate and therefore completely protected from the bank's insolvency estate.

### Institutional Governance Structure

Distributed key control reduces concentration risk. No single holder. No single point of failure.

### Transparent Economics

Client entitlements recorded and reconciled at all times. One controlled setup. No external custody handoffs.

### Banking License & MiCAR Authorised

Trading, staking and payments connect to the same custody layer. Integrated operations, not bolt-on infrastructure.

**Client Assets**

Recorded and reconciled in the bank's books and records

**Custody Layer**

Legal Segregation | MPC key control | Controlled movements | Conitnuous visibility

- No external custody handoff
- One regulated relationship
- Bank-grade control
- Continuous asset visibility

**Connexted Services**

Trading | Staking | Payments | Reporting

## Multi-Layered Security

Security operates across multiple independent layers. No single actor, system or compromise can access client assets.

### Strict Operational Governance

Asset movements require multi-layer authorisation. Procedures are designed to prevent both external attacks and internal misuse.

### Regulatory Oversight

Security architecture and operational procedures form part of the MiCAR licence and FMA supervision framework, and are continuously maintained, monitored, and enhanced as part of the bank's regulatory environment.

### On-Chain Transparency

Asset movements are recorded on-chain. Client positions are tracked and reconciled within one controlled environment — continuously and without manual intervention.

## Why a Bank as a Custodian Matters

This is not only a technology decision. It is a legal, regulatory and counterparty decision. A bank custodian provides a control framework that non-bank structures cannot replicate.

## Supported Currencies

Custody is available for selected digital assets, tokens and stablecoins that meet institutional eligibility criteria for liquidity, regulatory classification and operational security. Additional assets may be supported upon request, subject to review.
