

TReqs Technologies

The requirements & compliance tool enabling safer software faster

The Problem

As developer capacity increases, so does the need to showcase how software is compliant to regulation, industry standards, and product or project ambition. Traditional tools are complex, siloed, and detached from the development workflows. This often forces teams to manually collect evidence, duplicate documentation, and prepare compliance reports long after the actual development work is done. TReqs helps to avoid wasting time, costly delays, and potentially inaccurate documentation.

Business Impact

TReqs has three main goals that drive what we do:

- **Minimize compliance** as a bottleneck for development
- **Reduce overhead** by replacing manual audits with automated reporting
- **Ensure product readiness** by continuously connecting development to requirements

TReqs Solution

TReqs integrates requirements and compliance management with software development. The tool enables users to connect code with tests, requirements, and other knowledge.

This in turn enables automatic reporting of how a product is compliant with relevant requirements. TReqs stores and showcases this information in a way that provides teams and managers with critical insights into development progress from a compliance and audit perspective (e.g. safety, security, fit for purpose).

Next steps

We are now launching our first pilot projects together with selected partners. Our goal is to apply TReqs in industrial settings, solve their specific challenges, and learn from close collaboration. If you're interested in exploring how this could fit your team, we'd be happy to talk.
