- Automatic Fast Changeover on Failure of Primary Supply
- Active Supply Indication
- Fuse Live Indication
- Remote Status Via 9 way D-type
- 2 PowerCon Input Connectors
- 16 Amp Max Total Load, 6 Amp Max Load per Output
- 230Vac 50Hz

OVERVIEW - This unit safeguards equipment from primary mains supply failure with fast changeover time. 14 individually fused IEC outputs are housed in a sturdy 19" 1RU rack mounted enclosure, 195mm behind panel depth (300mm including lacing bar).

FEATURES - In normal operation the outputs are supplied from the primary supply. If the primary supply fails the relay switched to the secondary supply. The relay switches at ~20ms and the small glitch on the mains supply is dealt with by the power supplies in the powered equipment. The result is that the units remain powered without problems. This is especially true of any computers connected to the MDU. The two mains supplies may be independent but must be of the same phase.

On the return of the primary supply, the unit with switch back to primary power – again without issues. The switch is electrically after the relay and before the fused outputs and hence controls power output from the MDU. The unit is designed for total power loss.

The status of the unit is remotely available via a 9-way D-type on the rear panel. Relay contacts report on: Input A selected, input B selected and power available to output array.

(Order MDU14-C-M-002 for switchless version with indicator)

FINISH - The front panel comes in a standard semi-gloss black finish. (RAL9005).
