

Inato AI Patient Matching with EHR Integration

Impact

With EHR integrations, patient records now sync directly into Inato's AI-powered pre-screening tool, eliminating manual chart review and unlocking prescreening at scale.

This automation helps your teams rapidly identify and prioritize eligible patients across all trials, saving time and reducing operational burden.

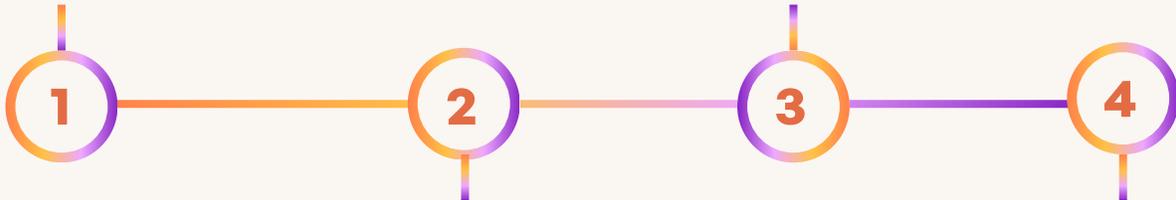

How it works:

1 Sign a BAA with Inato

To ensure HIPAA compliance and protect patient data.

2 Coordination with EMR provider

Inato will handle the technical build of the integration.

3 Identify your EMR administrator

Typically practice/office administrator or IT manager.

4 Final connection

Inato will send instructions for your EMR admin to connect on the back end.

"The pre-screening tool was great. User friendly, Easy to navigate. Saved us a great amount of time in chart review and helped us reduce the screen failure rate. It will sort out our patients who meet criteria or don't in less than a minute. I would tell anyone to use it without a doubt."

Berthold Vasquez, Assertive Clinical Research
