

Amino Orchestrate

Zero-touch provisioning and cloud control of devices, anytime, anywhere

Amino Orchestrate simplifies device management across multiple locations through its cloud-based tools. With an intuitive web interface, it streamlines firmware, configuration and application management for individual or groups of devices, all with just a few clicks. Additionally, it empowers users to swiftly resolve issues by remotely viewing and controlling screens, accessing advanced analytics and logging.

Benefits

Enable zero-touch deployment of screens

Centralized device management and software updates

Reduce time to resolution

Key features include

Powerful device diagnostics

Manage and schedule firmware and application updates

Device speed tests for confirming network bandwidth

Remotely view what is on your screens

APIs to enable easy integration with back-office systems

Remote access to bug reports and logs in Orchestrate

Simplify Management

Amino Orchestrate makes it easier for technicians to manage devices, software and device configurations. Technicians take control by managing devices via the cloud system. They can easily create target device groups and remotely assign software and configurations across large device populations, keeping separate groups under independent control for different purposes.

Orchestrate makes it easy to test new code or device configurations on "friendly" devices before deployment to production environments. This is done by simply selecting the test device group and assigning the desired firmware/device configuration. Once tested, users can launch new devices with the same configuration/firmware benefitting from the efficiency of Orchestrate zero-touch provisioning. This reduces the cost of roll out across large geographic regions and reduces the time to market for new launches.

Centralized Monitoring

A key advantage of the platform is remote on-screen viewing for any application via the UI, enabling centralized teams to validate delivery and troubleshoot issues. With a real-time customer-perspective view, teams can interact with the device as if on site. If it's not performing as expected, Orchestrate helps identify and fix issues remotely, reducing the time and cost of technician visits.

View and remote control

Enables review and interaction with any screen in the deployment as though a technician were on site.

Performance data

Includes network status, device port status, speed tests and performance metrics for media players and screens.

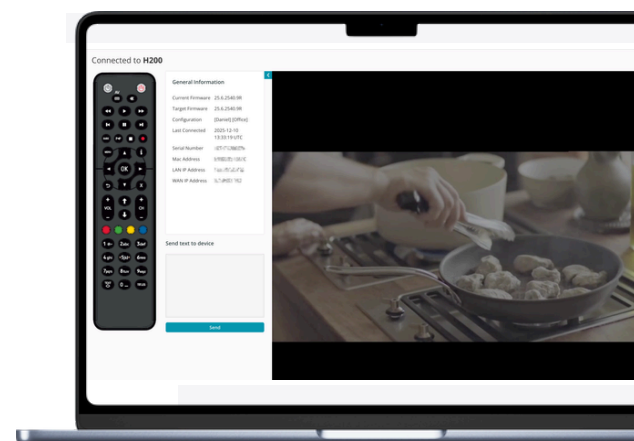

Diagnostics and troubleshooting

Enables capture of logging to the cloud, reboot, factory reset and bug reports for deeper diagnostics and resolution.

Validate Device Performance

Amino Orchestrate ensures your screens display content correctly, protecting your brand with quick problem resolution and lower support costs. As a cloud-based platform, Orchestrate offers enterprise-level reliability, making content delivery to any screen effortless.

Orchestrate offers two tiers of service:

Starter

Has the key functions to manage and deploy your H200 devices quickly and securely, allowing customers to reduce the complexity and time to market when building their first solution.

Free for the first 50 devices

Premium

Includes all features of starter but also gives the remote view and control functionality and provides access to the integration APIs.
