

From Setup to ROI in 12 Weeks

Our proven methodology delivers measurable supply chain improvements without disrupting operations.

Here's what to expect:

Weeks 1-2: Unified Data Foundation

What happens: We connect Sensium Data Flow to your existing systems (ERP, CRM, WMS, TMS, spreadsheets, market data) and consolidate everything into a single cloud repository.

What you get: One version of truth across sales, production, and inventory. No more reconciling conflicting spreadsheets or chasing down data sources.

Effort required: Minimal. Our Microsoft-native architecture means rapid integration with your existing tech stack.

Weeks 3-6: Intelligent Forecasting Engine

What happens: We deploy AI models calibrated to your business rules, validate forecasts with your planners, and configure our Adaptive AI and Sunny Copilot for your specific workflows.

What you get: Real-time forecasts and recommendations through Command Center. Your team starts seeing predictive insights immediately while we fine-tune accuracy.

Training: Intuitive interface with natural language interaction with our chatbot Sunny.

Weeks 7-12: Live Operations & Continuous Learning

What happens: Sensium becomes your daily planning backbone. We monitor forecast accuracy, inventory performance, and service metrics with you while the AI learns from each cycle.

What you get:

- *Immediate impact:* Forecast error reduction, optimized inventory buffers, proactive supply chain alerts
- *Embedded best practices:* Weekly alert reviews, scenario planning workflows, exception management
- *Compounding value:* The system gets smarter with every planning cycle

Ongoing: Cloud-based enhancements (new Copilot capabilities, predictive features) deploy automatically. No disruptive upgrades.
