To whom it may concern,

We have been using Slipcoat IRC at Ozinga for the last 3 years in our central mix plants and over the last 18 months in our mixer trucks. Over this time frame, we have seen our chipping time needed to clean out our central mix plants decrease dramatically. Normally we would be inside the drum once a week to clean the mixing fins, but under normal mixing conditions, we now perform this work appropriately once a quarter.

Regarding our mixer trucks, we use very high bag mixes in some of our work such as highway patching. In the past, the drums would get so built up we would have to put them out of service due to being unable to load them correctly. Since using Slipcoat, this is no longer a concern. Our trucks stay in service, and though we still have them chipped out quarterly as a preventative, we see approximately 75% less buildup come out of the drums. This is a huge cost savings for us as our chipping company charges us by the pound of material removed.

On another note, our Safety Department cannot say more good things as they are aware that Slipcoat greatly reduces the need for any person to enter a dangerous confined space as a mixer drum. I cannot say enough about this product and would recommend Slipcoat to anyone looking to reduce their chipping needs in any mixer drum and to operate in a safer environment for all their employees and outside contractors.

Please feel free to contact me with any questions.
