cyberhaven

Data Lineage: See Every Move Your Data Makes

Cyberhaven pioneered data lineage to map data at its origin, not just its location. Every move, copy, edit, or share is captured, creating a complete map of how sensitive information flows across your enterprise.

Data lineage powers three critical outcomes:

- **Accurate classification:** Context informs what is truly sensitive and reduces false positives.
- **Actionable insight:** Teams can enforce policies across endpoints, SaaS applications, and cloud environments.
- **Risk visibility:** Shadow copies, AI derivatives, and cross-system flows are all tracked in real time.

Unlike DSPM solutions built on static scans, Cyberhaven's lineage-first approach provides continuous, real-time insight. The result is a DSPM that sees more, understands better, and acts faster. This enables organizations to secure sensitive data confidently, even in AI-driven environments.

Why Lineage Matters:

- Detects hidden data exposure paths
- Feeds AI-driven classification with real context
- Enables risk-based prioritization and enforcement at machine speed
