An exact match cannot be guaranteed.

METALLIC GOLD 871

EcoRecord Color Table: Technical Specification

All colors and PMS references listed in the EcoRecord Color Table are for guidance only. An exact color match cannot be guaranteed.

Due to the innovative injection-molding process and the use of PET material, EcoRecords in clear, black and translucent colors have significantly lower surface noise than tradidional vinyl records.

Opaque-colored records use different material formulations from translucent-colored records, which can slightly affect surface noise. In some cases, this may be noticable as a subtle increase in noise, including occasional clicks in the lead-in and lead-out grooves or during quiet passages. Gold, silver and white may be particularly susceptible to such interference. Metallic gold and silver are approved for production using virgin PET.

Because colored EcoRecords are made from material from different color batches, slight variations are to be expexted. The perceived color may also vary depending on lighting conditions, background, opacity and record weight.

Sonopress

EcoRecord Inkplosion: Technical Specification

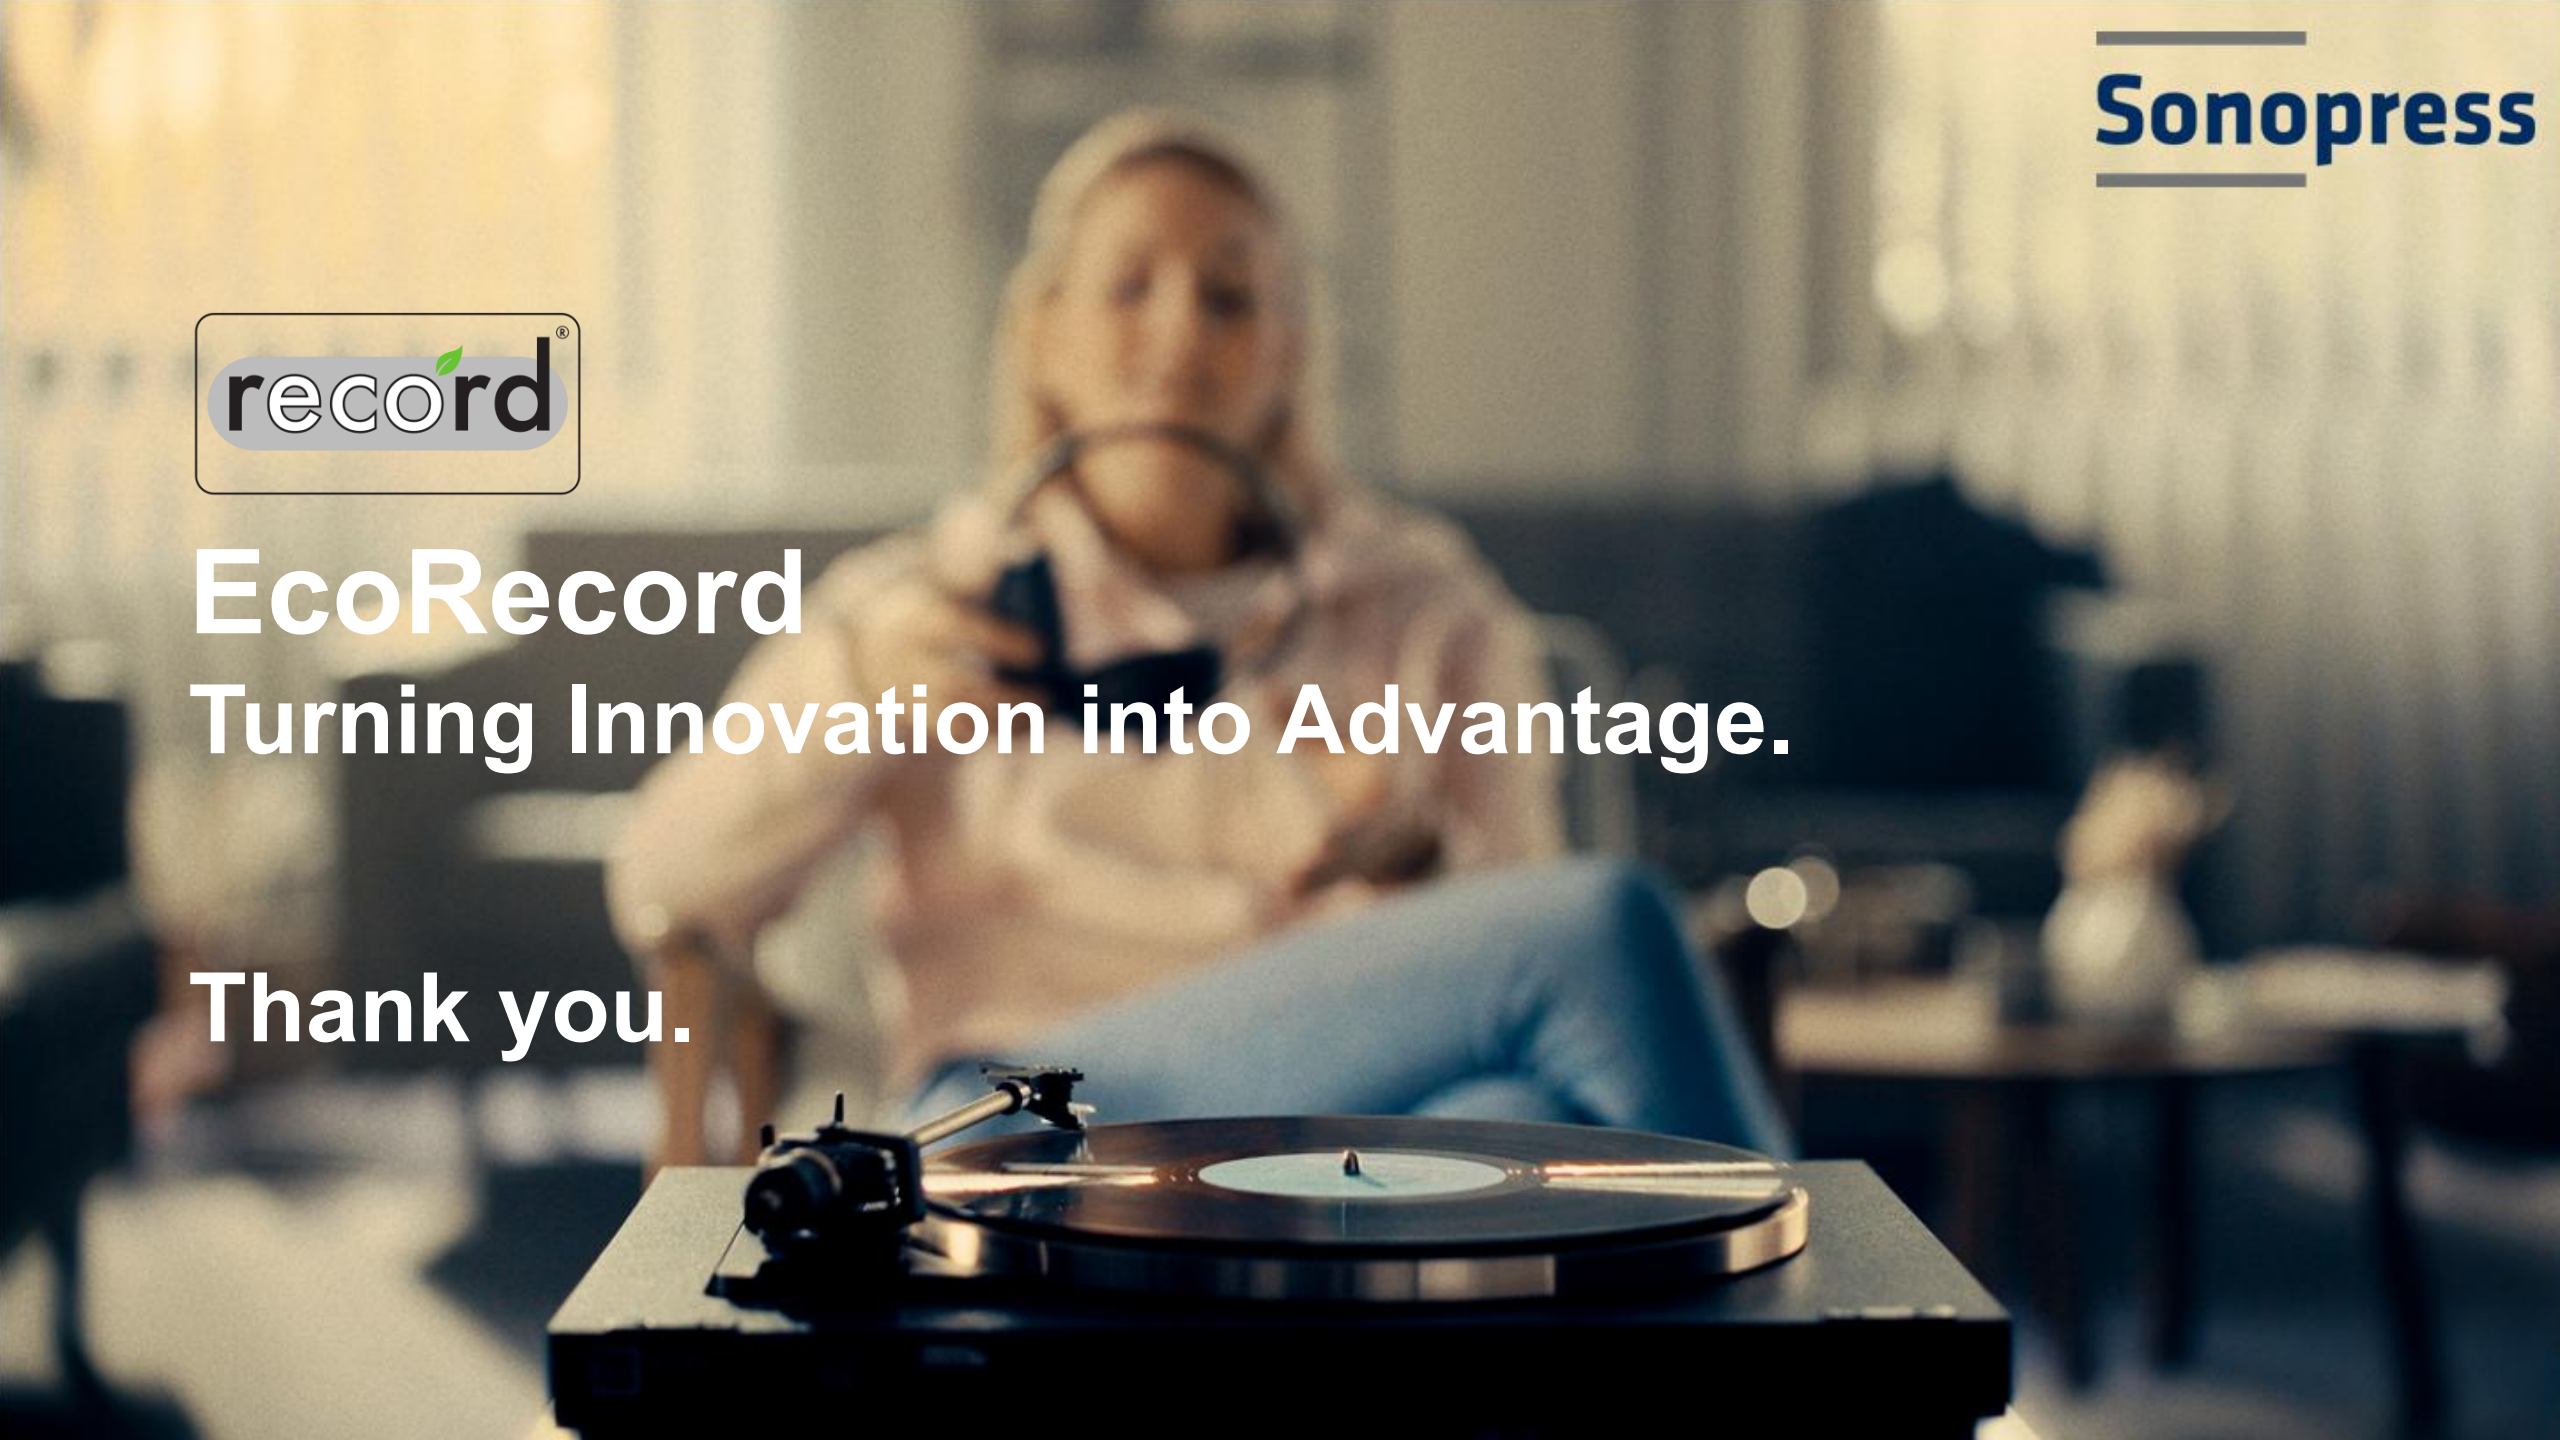

EcoRecord Inkplosion is an innovative color integration technology developed by Sonopress for its 140g PET-based record. The process introduces selected color pigments directly into the material during the fully automated manufacturing cycle, creating effects that are unique within the vinyl industry.

At the precise moment of molding, under defined temperature and pressure conditions, the pigments merge with the PET material. As the material flows and distributes within the mold, dynamic and organic structures naturally evolve. These effects are not printed or applied afterwards, they are an integral part of the record itself.

The resulting patterns are created by the physical interaction of heat, pressure and material flow. Micro-variations during the forming process generate expressive shapes that often evoke movement, rhythm and energy. Because the process relies on controlled physical dynamics, each record develops an individual and non-reproducible appearance. Exact forms, structures, or color proportions cannot be predefined or precisely controlled.

The EcoRecord can be produced with either a standard label measuring 10 cm in diameter or even a smaller 6 cm diameter label. The smaller label leaves more of the Inkplosion effect visible.

EcoRecord Inkplosion combines innovative production with advanced pigment integration technology, transforming every record into a unique visual statement while maintaining the advantages of the PET-based EcoRecord.
