Powering Value-Based Care with a Shared View of Cost, Care and Outcomes

Evidium's World Models for Healthcare connect clinical and financial intelligence to help organizations better align care decisions, financial performance and Value-Based Care (VBC) outcomes.

While Finance and Care Management teams have historically viewed the same members through different lenses, a world model enables these groups to see the same members, the same way, at the same time. World models represent what state a system is in, what drives it to the next state and where it is likely to go. For Value-Based Care, this means connecting clinical trajectories, care decisions and financial outcomes through a shared and more holistic view of each member.

Evidium's World Models for Healthcare: Our predictive clinical disease/diagnosis state, care and cost modeling solution gives organizations a shared view of risk. This includes, cost, stage and clinical trajectory, effectively connecting condition, care pathway and projected cost at the individual member level. As a result, stakeholders can better understand what is happening within care management and what comes next and what that may mean financially.

One Population. Two Perspectives. One VBC Strategy.

Finance focuses on cost, risk and financial performance. Care Management focuses on outcomes, appropriate care and intervention.

Evidium's World Models and growing number of precision models bring those perspectives together with the same data and logic.

Finance can better understand the dollar impact of a care intervention, and Care Management can similarly better understand the clinical implications of various financial decisions. Together, they can better and more holistically manage cost and quality as one whole-person-care equation.

Make Value-Based Care More Actionable

VBC succeeds when financial incentives and clinical outcomes are closely aligned and move in the same direction. Evidium gives stakeholders the intelligence to connect the two and do just that.

- **Design and manage VBC arrangements**
  Support shared savings, risk corridors and quality-based incentives with a shared whole-person view of expected clinical and financial performance.
- **Align care with financial outcomes**
  See how disease/diagnosis progression, treatment pathways and interventions may affect both outcomes and cost.
- **Track performance with greater confidence**
  Connect member-level clinical trajectories to financial projections and VBC performance metrics in a more holistic way.
- **Create a shared source of truth**
  Give Finance, Care Management and provider stakeholders transparent, evidence-based insight to reduce friction and more closely align around the same goals.

Same Data. Same Logic. One Shared Picture.

Evidium makes medical knowledge computational, combining trusted medical evidence with claims, utilization and other data to create dynamic, patient-specific models projecting disease progression, treatment pathways and their financial impacts.

Everyone can focus on the same thing: better outcomes, stronger VBC performance and sustainable healthcare costs.
