Orchestration Studio

Key Benefits

- ✔ **Automate high value steps:** Turn manual handoffs into automated actions. Route intakes, generate documents, attach files, create links, and run validations without redesigning your core workflows.
- ✔ **Scale with AI Agents:** Activate reusable AI Agents and templates from Levelpath’s Agent Library to deploy common patterns, including summaries, matches, and notifications across teams.
- ✔ **Accelerate cycle times:** Surface the right records automatically, match documents, and trigger next steps so invoices, contracts, and reviews move forward in seconds instead of stalling.
- ✔ **Gain clarity at every step:** Link invoices, contracts, POs, projects, and supplier records so teams see the complete picture, reducing risk and improving business outcomes.

Orchestration Studio is Levelpath’s customizable and intuitive AI Agent builder that orchestrates intelligent decisions and actions across your procurement workflows. Orchestration Studio sits on top of existing processes, automating routing, document generation, notifications, and decisioning to accelerate execution and eliminate manual work. By connecting reusable building blocks behind the scenes, Orchestration Studio enables the business to deploy powerful automations across sourcing, legal, contracts, finance, and invoice workflows, without hardcoding one-off solutions.

Launch Automation in Seconds

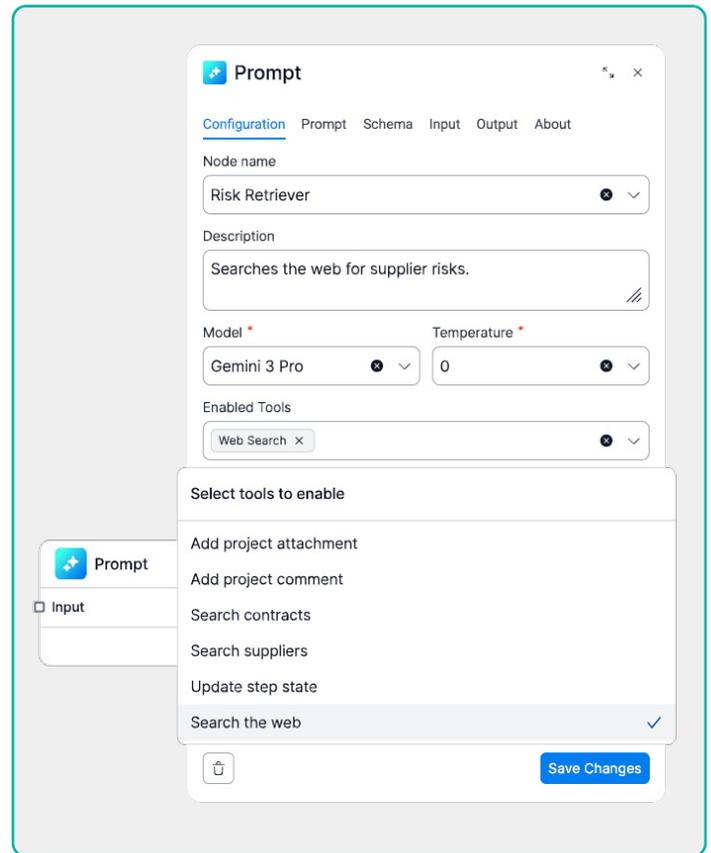

Create automated workflows that deploy instantly using event-driven triggers. When a step opens, OCR completes, or a sourcing event is submitted, Orchestration Studio retrieves the right context, applies conditional routing, and executes the next action without waiting for someone to intervene. The integration runs on top of existing workflows, so teams enable targeted automation quickly without changing how work is tracked.

Deploy Powerful AI Agents

The Agent Library gives the business a growing collection of pre-built, reusable AI Agents that can be activated, configured, and deployed directly within Orchestration Studio. Lightweight Task Agents handle summaries, extractions, and validations, while full Workflow Agents coordinate complex, multi-step orchestration across teams and systems. Every Agent operates within a governed permissions framework, giving procurement teams the speed they need without putting compliance or oversight at risk.

Accelerate Project Collaboration

Orchestration Studio connects cross-functional stakeholders by automating the coordination points that slow projects down. When a Legal step opens, legal-ready summaries are generated and sent automatically. Approvals route to the right people based on business rules, and teams can approve tasks and resolve exceptions from any device. The result is faster cycle times, fewer escalations, and projects that close on schedule instead of stalling in review.
