

Program structure Kombi

Kombi

Short description

The Kombi program structure with a total of 12 programs contains 6 ST programs based on the controls used in the past with timers, and 6 CH programs (for whole grape processing) with processing common for champagne.

Features and benefits

The structure of Willmes standard programs allows you to press all types of mash (crushed, destemmed, fermented, heated, etc.). The parameters can be changed easily and thus adapted to the conditions of the mash.

The structure of Willmes CH programs allows you to press whole grapes with minimal mechanical stress. The structure is based on the way of working in Champagne. The parameters can easily be changed and adapted to the condition of the grapes.
