Mobile hopper

for efficient filling via the cover

height adjustable

Short description

Made entirely of stainless steel, the mobile filling hopper from Willmes is the convenient and safe solution for gentle filling of your press via the cover opening using Euroboxes and a turntable.

Features and benefits

The mobile filling hopper is designed for flexible working on the press. It has four large plastic rollers and a lifting mechanism. The rollers allow the filling hopper to be moved and to be placed on the press manually without the aid of a forklift or similar heavy equipment. It can easily be raised and lowered with the lifting device to bring it as close as possible to the cover. This is also useful when rocking, or rotating during filling. The hopper then remains on the press.

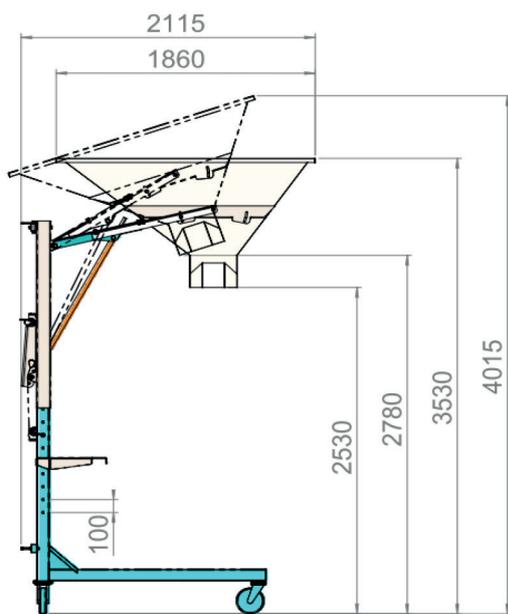

A sturdy ladder is attached to the side of the hopper so the filling level can be monitored personally at any time. For safety reasons, the hopper is hooked onto the press frame at two points.

The height of the filling hopper frame can be adjusted so it can be used with different sized presses. The mobile filling hopper can be used as standard on presses from SIGMA 2 to SIGMA 16, depending on its frame height.

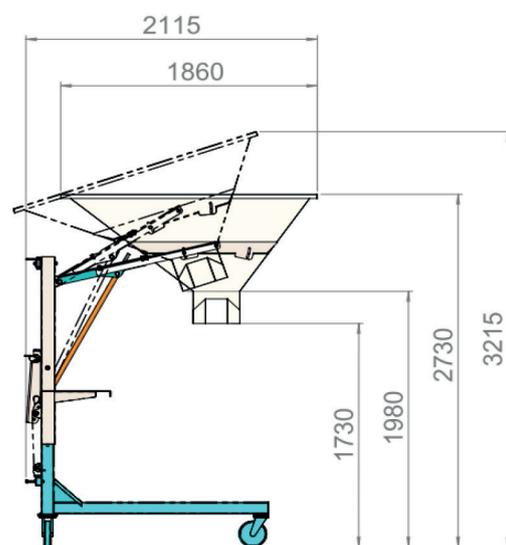

It can be disassembled into individual parts to save space, or simply pushed to its storage location.

Technical details

Side view with maximum heights

Side view with minimum heights

Total weight: approx. 230kg

Material: Stainless steel 1.4301

Fits for presses from SIMGA 2 to SIGMA 16 (depending on its frame height).
