automatic cleaning program

for the tank interior

rapid
cleaning

automatic
program
process

Short description

The automatic cleaning program is designed for fast, effective and resource-saving cleaning of the press at the press of a button.

Features and benefits

The cleaning program proceeds as follows:

- the membrane is slightly inflated to release all pomace residues and prevent wrinkling of the membrane.
- water or a cleaning solution flows for an adjustable time into the press tank via the axial connection.
- the rinse cycle begins.
- The cleaning fluid can be discharged later via the filling door(s) or the juice drain valve.

The cleaning program runs for 5 to 15 minutes, depending on the type of machine, plus the time required for filling in the water or cleaning fluid.

The customer only needs to provide a water connection.
