Energy Level Increases on Average

Hike Medical takes a preventative approach to MSK challenges, addressing them at their source —the feet— to reduce costs and avoid future escalations down the line.

Musculoskeletal (MSK) conditions are the leading driver of healthcare costs and a persistent challenge for employers across all industries, particularly those with large on-your-feet populations. These painful issues lead to more sick days, lower productivity, and higher healthcare spending.

Key benefits for your organization

Prevent MSK-related costs:

Reduce the risk of chronic conditions – like knee and back pain that may require surgery.

Drive employee engagement:

Improve comfort and morale across your workforce with a benefit they'll actually use.

Boost productivity:

Minimize the physical strain that impacts the body and job performance.

COMING SOON

Foot health is a signal of overall well-being.

Addressing foot pain proactively can prevent a cascade of related health issues, including weight gain, diabetes, heart disease, and depression.

How it works:

Hike's PDAC-approved custom insoles leverage AI-driven precision and clinical design to bring medical-grade comfort to every employee—without clinic visits or claims.

Through a simple 5-minute smartphone scan, our platform captures each person's exact foot profile, generates a custom 3D model, and produces 3D-printed insoles shipped directly to their home.
