**FOR IMMEDIATE RELEASE**

## **Soleran Launches a New Era of No Code Configuration, Visibility, and Scalability in Healthcare Facility Operations**

***New release brings together configurable workflows, real-time visibility, and a scalable marketplace of apps for modern facility operations.***

Overland Park, KS – July 1st, 2026 – Soleran, a leader in configurable software for facility operations, today announced the launch of its new platform, Soleran Oro, designed to help hospitals and healthcare organizations manage facility operations with greater visibility, flexibility, scalability, and confidence.

Built for today's fast-moving healthcare environments, the new platform delivers a more intuitive, streamlined experience for teams responsible for work orders, rounding, permits, project workflows, contractors, safety, compliance activities, reporting, and more. The release reflects Soleran's continued focus on helping healthcare organizations replace disconnected systems and manual processes with one connected, configurable platform built around the way hospital facility teams and enterprise healthcare organizations actually work.

Hospitals and healthcare systems manage some of the most complex facility environments in the world. From maintaining safe care spaces and supporting regulatory readiness to coordinating work across departments, campuses, contractors, and leadership teams, healthcare facility operations require systems that can keep pace with constant change. Soleran Oro was built to support that reality.

At the center of the launch is a cutting edge platform experience that helps users move through tasks with fewer clicks, fewer handoffs, and less friction. From frontline users to organizational leaders, teams can access the tools, workflows, and visibility they need to keep operations moving without unnecessary complexity.

"Healthcare facility teams need software that can keep up with the pace, pressure, and complexity of their work," said Jill Allen, Vice President of Marketing at Soleran. "This launch is about giving hospitals and healthcare organizations more flexibility through user configuration (no code); more visibility through complete integration of any tool they currently work with plus any Soleran apps, and more control in a platform that is built to adapt to them and their team – not force them into a rigid system."

Unlike one-size-fits-all software, Soleran's platform is highly user-configurable, allowing organizations to tailor workflows, forms, dashboards, reports, permissions, and routing to match their unique operational needs without the use of coding skills. This no-code flexibility gives teams the ability to make changes, expand capabilities, and scale over time without relying on custom development and their IT team for every adjustment.

The launch also introduces Soleran Oro Marketplace as the first marketplace for facility management applications – a distinctly new concept for the facility management software industry. Built into the Soleran ecosystem, Soleran Oro Marketplace gives healthcare organizations a way to build the platform they need today and expand it over time within the same connected system. Rather than forcing facilities teams into a fixed set of tools, the Soleran Oro Marketplace gives them the flexibility to add best practice apps, templates, and white label solutions as their operational needs grow and change. This creates a more scalable, customizable approach that is rarely seen in healthcare facility management software and is especially valuable for healthcare organizations managing multiple facilities, departments, standards, and compliance-driven workflows.

“We are extremely proud of Soleran Oro Marketplace. It is like a solution store for facility management teams. A facility can select what application they need and add it to their existing applications right inside our platform. There is nothing else like this in the facility management space,” said Jill Allen, Vice President of Marketing.

Key benefits of the Soleran Oro platform include:

- User configuration including configurable workflows tailored to each organization’s processes
- Connected Soleran Oro Marketplace to expand functionality over time
- Role-based permissions and scalable access across teams, campuses, and departments
- One integrated platform that reduces reliance on disconnected tools and manual workarounds
- Real-time dashboards, analytics, and reporting for better visibility

For hospital and healthcare organizations managing complex facility operations, the result is a single platform designed to connect data, improve efficiency, simplify day-to-day work, and provide clearer insight into what is happening across teams and departments. One familiar platform also reduces team training times and implementation complexity.

“This is more than a visual refresh or a software update,” said CEO, Grady Hawley. “It’s a flexible, more scalable platform built to help healthcare facility teams work smarter and grow without adding more complexity.”

Soleran’s new platform is now available for organizations looking to modernize healthcare facility operations with a configurable, connected approach that supports both current needs and future growth.
