

Frequently Asked Questions

1. What are sports betting models?

Sports betting models use data and structured logic to forecast game outcomes, spreads, totals, and props. On Moddy, every model is built by creators, tracked in real time, and evaluated based on actual betting performance.

2. Can I see what models are powering predictions?

Yes. Every pick shows you exactly which models are contributing to it, along with their individual performance history. Full transparency: you can dig into any model you want.

3. Are Moddy's betting models transparent?

Yes. Every model on Moddy includes visible performance history so users can see how it has performed over time.

4. Is Moddy an AI betting app?

No. Moddy isn't a sportsbook or an automated betting app. Moddy has two sides: a model-building platform for creators who want to build and track AI-powered prediction models, and a bettor app that surfaces picks from those models with full performance transparency. You decide what to bet and where. Moddy provides the data.

5. How do I download the app?

The Moddy app is available on both iOS and Android. Search for "Moddy AI" in the App Store or Google Play, or visit moddy.ai/app to download directly. A 7-day free trial is included — no credit card required.

6. Can I track my own bets in the app?

Yes. Save any pick to your bet slip and Moddy tracks your results automatically — win rate, ROI, and full betting history across 7-day and 30-day windows. You can see exactly how your saved picks are performing over time.

Frequently Asked Questions

7. How are Top Picks selected?

Top Picks are surfaced by Moddy's AI curation engine, which identifies the strongest signals from top-performing models based on documented track records — not opinions, not hot takes. Every pick includes the model behind it, the line, and the performance history so you can evaluate it yourself before acting.

8. Can anyone build a betting model on Moddy?

Yes. Moddy's platform is designed for anyone — from casual fans to advanced bettors — to build prediction models without any coding or data science experience. You work with our AI assistant through a simple chat interface, and Moddy handles the data, testing, and performance tracking.

9. Does Moddy guarantee winning bets?

No. Sports betting always involves risk, and no model can guarantee wins. Moddy's goal is to give you better information, with performance-tested models and transparent results, so you can make smarter decisions. You're always in control of what you bet and where.

10. What sports does Moddy cover?

Moddy currently covers NBA, MLB, and NFL. Bettors can follow picks across all three sports in the app. Creators can build models for spreads, totals, moneylines, and player props across all available sports.

11. Is Moddy free?

Moddy offers free trials on all plans — no credit card required. Creator plans include a 14-day free trial with full access. The bettor app includes a 7-day free trial. Pricing varies based on features and access level. Visit our pricing page to see current plans.

12. How is Moddy different from pick sites?

Pick sites share selections. Moddy tracks performance. At Moddy, every model's predictions and results are visible in public. Performance, not personality, determines influence. You can review the full history before making a decision.

Frequently Asked Questions

13. Does Moddy place bets for me?

No. Moddy is not a sportsbook. We provide performance-tracked predictions and consensus signals. You decide where, when, and how to place a bet using your platform of choice.

14. Is using Moddy legal?

Yes. Moddy is an information and analytics platform. We do not accept wagers or operate as a sportsbook. You can use Moddy alongside any legal betting platform in your state.

15. How is this different from ChatGPT or AI picks?

Large Language Models generate text. They don't build, train, or track structured predictive models. Moddy uses widely accepted and cutting edge predictive modeling techniques, trained on real sports data. Models are backtested, retrained over time, and evaluated against real market outcomes. Every prediction is measurable and tracked. Smart Picks aren't generated from prompts; they're derived from performance-tested models with public track records. That's the difference between AI text and predictive modeling.
