

MiniProto

**QUOTE-TO-BUILD AUTOMATION FOR CUSTOM WIRE HARNESSSES,
THE MOST MANUAL PART OF HARDWARE BUILDS**

CUSTOM WIRING STILL LIVES IN 1985 AND HOLDS BUILDS BACK

THE PROBLEM IS HARD...

- **Every harness is different** - lengths, connectors, pinouts, labels, sleeving, splices, etc.
- **No universal format** for communicating designs (unlike Gerber for PCB and STEP for MCAD)
- **Millions of component options** with varying degrees of documentation and tooling
- **Automation is difficult**, often requiring days of fine tuning for specific jobs

..AND NO ONE WANTS TO DO IT

- **No one is a specialist** - in-house manufacturing teams often treat wiring as an afterthought, leading to last-minute crunches
- **Manual and human-intensive** processes for quoting and production
- **Job sent overseas for decades**, with only high end manufacturing left onshore, all with high MOQs
- **Largely interdisciplinary effort** requiring careful coordination between mechanical and electrical teams, with neither having ownership

RESULT:

- 4-6+ week lead times for even simple prototypes
- 2-6+ month lead times for complex production runs

CUSTOM WIRING IS THE LAST BOTTLENECK IN MANUFACTURING

CUSTOM HARDWARE

1-5 Days ✓

PROTOLABS

CUSTOM CIRCUIT BOARDS

1-2 Weeks ✓

MACROFAB

JLCPCB

MOTORS, HARDWARE, AND SENSORS

1-5 Days ✓

CUSTOM WIRING

4-6 Weeks ✗

DELAYS IN WIRING HOLD UP THE ENTIRE BUILD PROCESS

A \$20B INDUSTRY RIPE FOR DISRUPTION

\$20B

U.S. Wire Harness Market

\$60-100B Globally

\$2-3B

Target Segment

Low to mid volume, speed at a premium

WHY NOW

RESHORING MOMENTUM

Supply chain fragility pushing manufacturing back to U.S.

DEFENSE SUPPLY CHAIN SCRUTINY

Domestic sourcing requirements and refocus on supply chain depth and innovation

ROBOTICS & DRONE BOOM

Hardware companies scaling faster, need flexible suppliers

AUTOMATION ADVANCES

Digital manufacturing, AI, and automation hardware mature enough to tackle labor intensive processes

WHOSE PAIN POINTS WE ARE SOLVING

R&D ENGINEER

Context: Designing a warehouse robot module to handle baggy parcels that snag, slump, and break neat assumptions. Specs change weekly

Pain point: Needs 10-50 harnesses yesterday to hit a milestone, can't wait 6 weeks

Values: Speed, no MOQs, instant quoting without procurement gymnastics

SYSTEM INTEGRATOR (INDUSTRIAL AUTOMATION)

Context: Delivering a bespoke, turnkey robotic depalletizing cell for a major retailer

Pain point: Every project is bespoke. Late changes (zones, sensors, safety circuits) trigger harness revisions and requotes, and slow suppliers can stall on-site commissioning

Values: Flexibility, reliable lead times, quick requotes when specs change

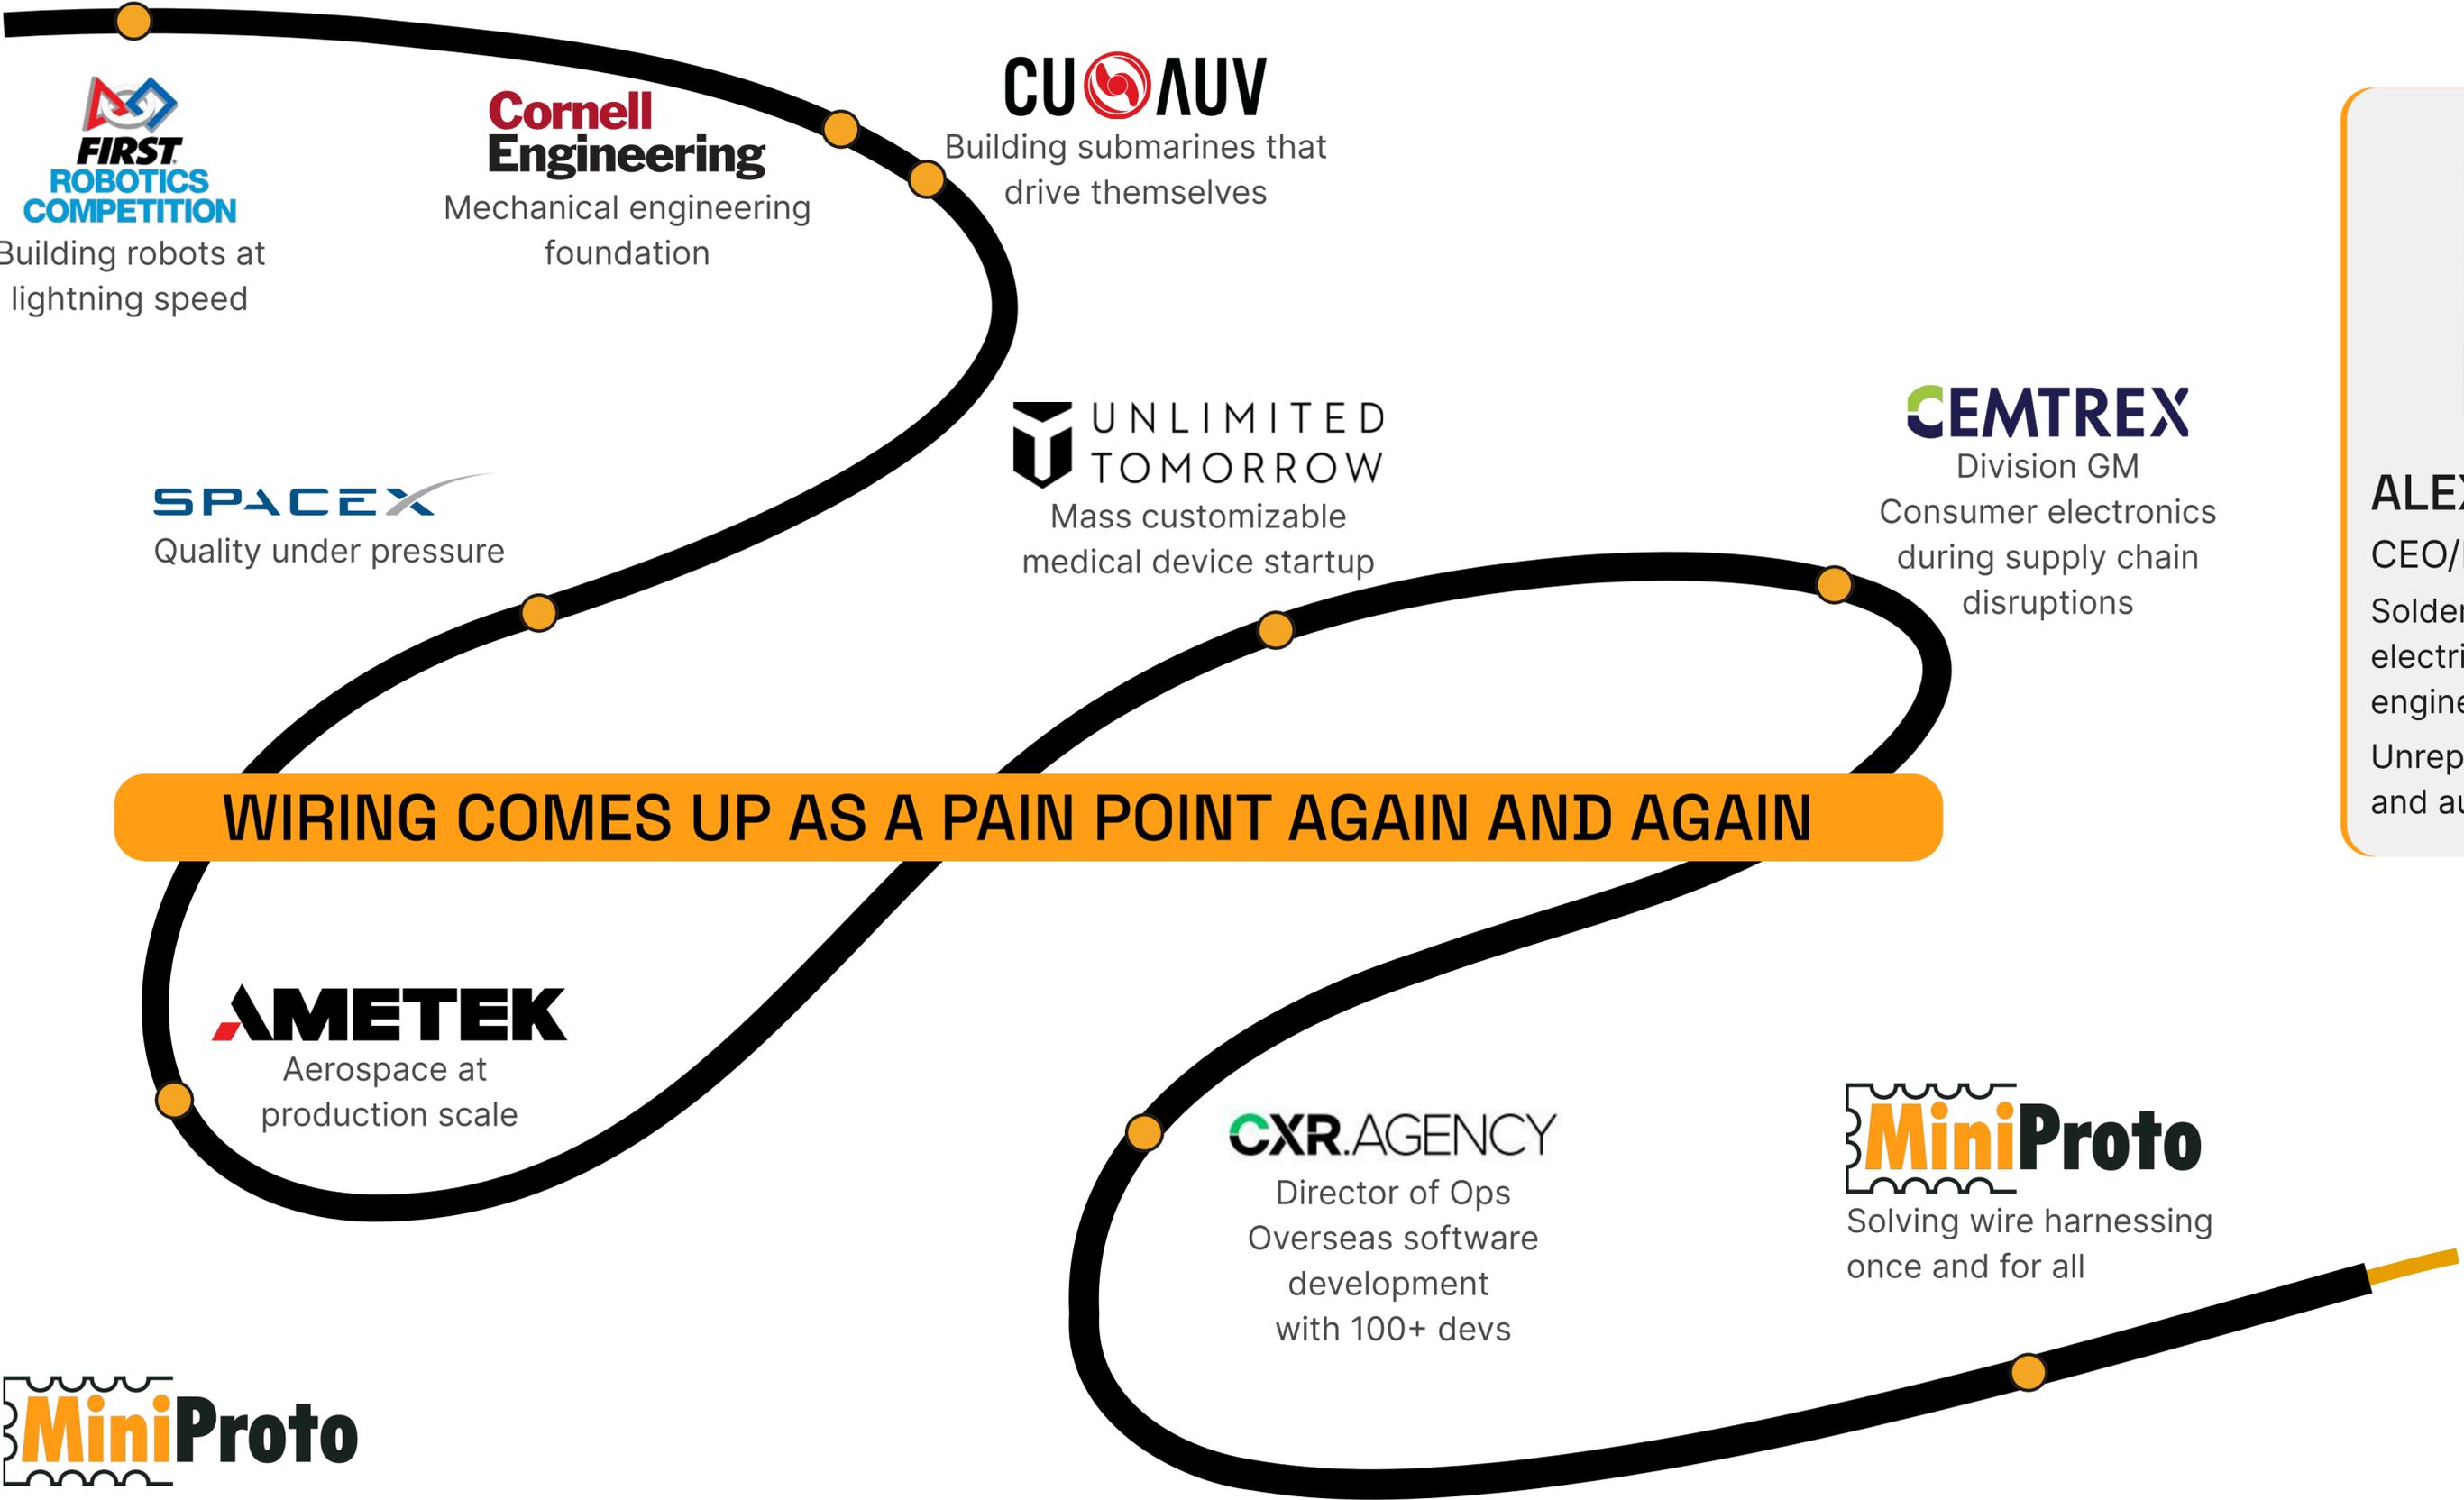

PROCUREMENT SPECIALIST

Context: Sourcing wiring as PDW ramps a modular, multi-mission quadcopter from prototype into low-rate production, while payload configs keep evolving

Pain point: Overseas can look cheaper but adds lead time and quality risk; domestic options are expensive and still slow

Values: Predictable pricing, U.S.-based supplier

WHY WE CAN AND WANT TO SOLVE IT: FOUNDING STORY

ALEX MALCOCI
CEO/Founder
Solders together mechanical, electrical, and software engineering
Unrepentant systems thinker and automator

OUR SOLUTION: AN OPERATING SYSTEM FOR WIRE HARNESSSES

PCBS HAVE MACROFAB. CNC HAS XOMETRY.

WIRE HARNESSSES HAVE... EMAILS AND PHONE CALLS. UNTIL NOW.

WHAT IS MINIPROTO?

- 1. A configurator that speaks manufacturing** - Engineers design in a tool that only allows buildable specs. No back-and-forth, no DFM surprises
- 2. Single source of truth** - The same configuration drives quoting, purchasing, and work instructions. No handoffs, no translation errors
- 3. Software-first, manufacturing-second** - The configurator is the product. Today we fulfill orders ourselves. Tomorrow we're the platform

The screenshot displays the MiniProto Wire Harness Configurator interface. The main workspace shows a wire harness diagram with various components (L0, L1, L2, L3, R1, R2, R4) and wires (W0-W18) connecting them. The interface includes a navigation bar at the top with links for 'About', 'Products', 'Solutions', 'Services', 'Industries', 'Blog', and 'Admin'. There are also buttons for 'Configurator' and 'Upload Design'. The bottom of the interface shows a price calculation: '\$122.69 + \$18.40 tariff (15%) = \$141.09', a quantity of 10, and a lead time of 15 to 20 days to ship. There are also buttons for 'Add to Cart' and 'Chat with us'.

HOW IT WORKS: DESIGN (1/4)

CURRENT STATE

1. **Electrical engineer specs electrical requirements** - pinout, connectors, AWG, etc.
2. **Mechanical engineer determines lengths needed**
3. **Mechanical engineer must document design** using tools like RapidHarness, WireViz, hand sketching, Mechanical CAD, Excel
4. **Manufacturer reviews drawings** and generally has significant back and forth over component choices, availability, and manufacturability

THE MINIPROTO WAY

1. **Electrical engineer configures harness** in the online configuration tool
2. **Mechanical engineer adjusts lengths** in the online tool.
3. **Manufacturability (DFM) check happens live** as only buildable options are available
4. **Done** - spec is production-ready

WHY WE WIN:

- **DFM built in** - you can only design what we can build
- **Nothing lost in translation** - everyone in a mutually understood format

HOW IT WORKS: QUOTING (2/4)

CURRENT STATE

1. **Contract manufacturer (CM) receives spec package** from the customer
2. **CM manually prices out BOM** (connectors, wire, labor) and **builds quote**, including back and forth over design interpretation
3. **CM issues quote**, often revising multiple times to meet cost targets by adjusting components and design

THE MINIPROTO WAY

1. **Engineer receives pricing instantly** from the configuration tool **as soon as the design is complete**
2. **Specs or quantity change? Price updates instantly**
3. **Done** - quote is ready when design is ready

WHY WE WIN:

- **No sales engineer in the loop** - saves cost, saves time, and minimizes interpretation errors
- **Margin flexibility** - lower overhead means savings we can pass to customers

HOW IT WORKS: MANUFACTURING (3/4)

CURRENT STATE

1. **CM engineer interprets specs** and **creates internal work order**
2. **Bills of material created and shopped for manually**
3. **Ambiguity? Engineer goes back to clarify** or makes a judgment call
4. **Skilled technicians build harness** based on interpretation
5. **Hope it matches what customer actually wanted**

THE MINIPROTO WAY

1. **Configurator sends the quote into the internal systems**, generates standardized digital work instructions and shopping lists
2. **Technicians execute** - every wire, connector, and pin pre-defined
3. **Done** - no interpretation, no guesswork

WHY WE WIN:

- **Technicians execute** without spending time interpreting
- **Faster, fewer errors**, less reliance on tribal knowledge

HOW IT WORKS: QUALITY CONTROL (QC) (4/4)

CURRENT STATE

1. **QC inspector** receives finished harness and **compares against the same ambiguous drawing**
2. **QC inspector manually verifies** tedious elements like pinouts, lengths, and continuity
3. **QC inspector passes/fails** based on the interpretation, experience, and judgement
3. **Issues found? Trace back** through the ambiguity chain

MINIPROTO WAY

1. **Configurator generates inspection checklist and automated testing automatically**
2. **Every checkpoint tied to original spec.** Pass/fail is objective, not interpreted
3. **Done** - traceable, verifiable, fast

WHY WE WIN:

- **Inspection criteria auto-generated from the design**
- **No "I think this is right" moments**

BUSINESS MODEL

SOFTWARE-ENABLED HARNESS MANUFACTURING TODAY

MINIPROTO CONFIGURATION TOOL
→ QUICK-TURN CUSTOM WIRE HARNESS MANUFACTURING

- **Revenue streams:** harness builds, rush order premiums, design-for-manufacture (DFM) support
- **Pricing power:** customers pay for certainty and speed (not just materials)
- **Margin leverage:** automation reduces labor per quote/order and raises throughput

PLATFORM OPTIONALITY TOMORROW

SAAS: WIRE HARNESS DESIGN TOOL & SPEC STANDARDIZATION
Monetization: per-seat subscription (industry example: RapidHarness)
Why it's strategic: turns quoting inputs into structured data

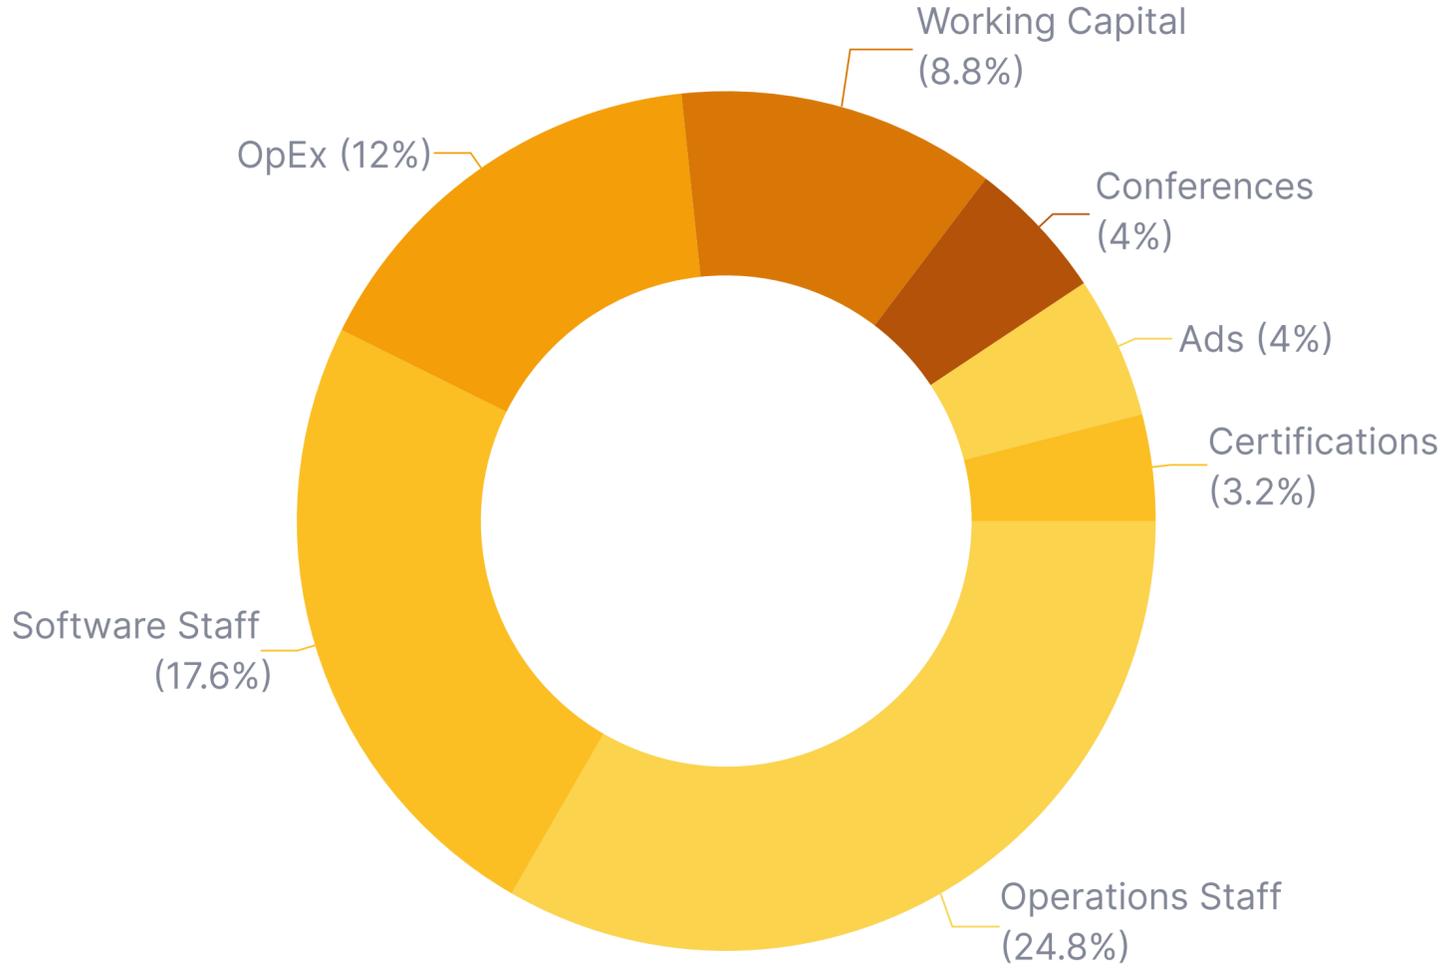

MANAGED SUPPLIER MARKETPLACE
Monetization: spread on fulfilled orders (industry example: Xometry)
Why it's strategic: scales capacity without scaling headcount/capex

EXPAND INTO ADJACENT CUSTOM MANUFACTURING
Monetization: same playbook (industry example: Protolabs)
Why it's strategic: reuses the hard part (workflow, rules)

RAISE AND USE OF FUNDS

WE'RE RAISING A **SEED ROUND OF \$1.5M**
TO BUILD OUT OUR PLATFORM AND ACT ON CLEAR DEMAND

ESTIMATED USE OF FUNDS

GOAL 1: BUILD OUT CONFIG TOOL
Achieve >90% of orders through config tool
Validate SaaS demand with 100+ paid users for design features

GOAL 2: RAPIDLY SCALE REVENUE
Grow to >\$500k MRR in <24 months from current \$50k
Retain <\$500 CAC and grow customer LTV

GOAL 3: INCREASE THROUGHPUT AND EFFICIENCY
Increase headcount, space, and equipment to match revenue targets
Automate and speed up processes to raise gross margin to 40-50% from 30%
Pilot supplier network to test marketplace model
