

COLDFUSION® WITH COLD CARBONATION INSTALLATION MANUAL

Release Date: 2008

Publication Number: 621057625INS

Revision Date: February 19, 2014

Revision: F

Visit the Cornelius web site at www.cornelius.com for all your Literature needs.

The products, technical information, and instructions contained in this manual are subject to change without notice. These instructions are not intended to cover all details or variations of the equipment, nor to provide for every possible contingency in the installation, operation or maintenance of this equipment. This manual assumes that the person(s) working on the equipment have been trained and are skilled in working with electrical, plumbing, pneumatic, and mechanical equipment. It is assumed that appropriate safety precautions are taken and that all local safety and construction requirements are being met, in addition to the information contained in this manual.

This Product is warranted only as provided in Cornelius' Commercial Warranty applicable to this Product and is subject to all of the restrictions and limitations contained in the Commercial Warranty.

Cornelius will not be responsible for any repair, replacement or other service required by or loss or damage resulting from any of the following occurrences, including but not limited to, (1) other than normal and proper use and normal service conditions with respect to the Product, (2) improper voltage, (3) inadequate wiring, (4) abuse, (5) accident, (6) alteration, (7) misuse, (8) neglect, (9) unauthorized repair or the failure to utilize suitably qualified and trained persons to perform service and/or repair of the Product, (10) improper cleaning, (11) failure to follow installation, operating, cleaning or maintenance instructions, (12) use of "non-authorized" parts (i.e., parts that are not 100% compatible with the Product) which use voids the entire warranty, (13) Product parts in contact with water or the product dispensed which are adversely impacted by changes in liquid scale or chemical composition.

SAFETY INSTRUCTIONS

READ AND FOLLOW ALL SAFETY INSTRUCTIONS

Safety Overview

- Read and follow **ALL SAFETY INSTRUCTIONS** in this manual and any warning/caution labels on the unit (decals, labels or laminated cards).
- Read and understand ALL applicable OSHA (Occupational Safety and Health Administration) safety regulations before operating this unit.

Recognition

Recognize Safety Alerts

This is the safety alert symbol. When you see it in this manual or on the unit, be alert to the potential of personal injury or damage to the unit.

DIFFERENT TYPES OF ALERTS

DANGER:

Indicates an immediate hazardous situation which if not avoided **WILL** result in serious injury, death or equipment damage.

WARNING:

Indicates a potentially hazardous situation which, if not avoided, **COULD** result in serious injury, death, or equipment damage.

CAUTION:

Indicates a potentially hazardous situation which, if not avoided, **MAY** result in minor or moderate injury or equipment damage.

SAFETY TIPS

- Carefully read and follow all safety messages in this manual and safety signs on the unit.
- Keep safety signs in good condition and replace missing or damaged items.
- Learn how to operate the unit and how to use the controls properly.
- **Do not** let anyone operate the unit without proper training. This appliance is **not** intended for use by very young children or infirm persons without supervision. Young children should be supervised to ensure that they do not play with the appliance.
- Keep your unit in proper working condition and do not allow unauthorized modifications to the unit.

QUALIFIED SERVICE PERSONNEL

WARNING:

Only trained and certified electrical, plumbing and refrigeration technicians should service this unit. **ALL WIRING AND PLUMBING MUST CONFORM TO NATIONAL AND LOCAL CODES. FAILURE TO COMPLY COULD RESULT IN SERIOUS INJURY, DEATH OR EQUIPMENT DAMAGE.**

SAFETY PRECAUTIONS

This unit has been specifically designed to provide protection against personal injury. To ensure continued protection observe the following:

WARNING:

Disconnect power to the unit before servicing following all lock out/tag out procedures established by the user. Verify all of the power is off to the unit before any work is performed.

Failure to disconnect the power could result in serious injury, death or equipment damage.

CAUTION:

Always be sure to keep area around the unit clean and free of clutter. Failure to keep this area clean may result in injury or equipment damage.

SHIPPING AND STORAGE

CAUTION:

Before shipping, storing, or relocating the unit, the unit must be sanitized and all sanitizing solution must be drained from the system. A freezing ambient environment will cause residual sanitizing solution or water remaining inside the unit to freeze resulting in damage to internal components.

CO₂ (CARBON DIOXIDE) WARNING

DANGER:

CO₂ displaces oxygen. Strict attention **MUST** be observed in the prevention of CO₂ gas leaks in the entire CO₂ and soft drink system. If a CO₂ gas leak is suspected, particularly in a small area, **IMMEDIATELY** ventilate the contaminated area before attempting to repair the leak. Personnel exposed to high concentrations of CO₂ gas experience tremors which are followed rapidly by loss of consciousness and **DEATH**.

MOUNTING IN OR ON A COUNTER

WARNING:

When installing the unit in or on a counter top, the counter must be able to support a weight in excess of **620 lbs.** to insure adequate support for the unit. **FAILURE TO COMPLY COULD RESULT IN SERIOUS INJURY, DEATH OR EQUIPMENT DAMAGE.**

NOTE: Many units incorporate the use of additional equipment such as icemakers. When any addition equipment is used you must check with the equipment manufacturer to determine the additional weight the counter will need to support to ensure a safe installation.

GENERAL INFORMATION

The ColdFusion® series of dispensers solves your ice and beverage service needs in a sanitary, space saving, economical way. Designed to be manually filled with ice from any remote ice-making source, these dispensers will dispense cubes (up to 1-1/4 inch in size), cubelets, and compressed (not flaked) ice. In addition, the units include beverage faucets, a cold plate, an internal carbonator tank and an external pump for the carbonator, and are designed to be supplied direct from syrup tanks with no additional cooling required.

CAUTION:

Dispenser cannot be used with crushed or flaked ice. Use of bagged ice which has frozen into large chunks can void warranty. The dispenser agitator is not designed to be an ice crusher. Use of large chunks of ice which “jam up” inside the hopper will cause failure of the agitator motor and damage to the hopper. If bagged ice is used, it must be carefully and completely broken into small, cube-sized pieces and left to “temper” or warm up for a minimum of 20 minutes in room temperature before loading into the dispenser hopper.

SPECIFICATION

Model Descriptions:	B=Beverage C=Coldplate H=Internal Cold Carb Z=No Drip Tray
Ice Storage:	255 Pounds
Maximum Number of Faucets Available:	4 nozzles with 4 brands each = 16 brands
Built-in Cold Plate:	Yes
Electrical:	120/1/60, 9.3 Amps of Total Unit Draw 220/1/50, 4.7 Amps of Total Unit Draw
Dimensions:	30 in. wide 31-1/8 in. deep 39 in. high (to top of bin) 39-3/4 in. high (to top of lid) Z-Models 30 in. wide 23-9/16 in. deep 39 in. high (to top of bin) 39-3/4 in. high (to top of lid)
CO2 Operating Pressure	75-psig (max) for carb tank and brand syrup pumps

INSTALLATION

TO THE INSTALLER

WARNING:

It is the responsibility of the installer to ensure that the water supply to the dispensing equipment is provided with protection back flow by an air gap as defined in ANSI A 112.1.2-1979; or an approved vacuum breaker or other such method as proved effective by test and must comply with all federal, state and local codes.

Failure to comply could result in serious injury, death or damage to the equipment.

Water pipe connections and fixtures directly connected to a potable water supply shall be sized, installed and maintained according to Federal, State and Local laws.

Water pipe connections and fixtures directly connected to a potable water supply shall be sized, installed and maintained according to Federal, State and Local laws.

1. Locate the dispenser indoors on a level counter top.

A. LEG OPTION

Unpack the four (4) legs and install them into the threaded holes provided in the bottom of the unit. The installer must provide flexibility in the product and utility supply to permit shifting the position of the dispenser sufficiently to clean the area beneath it. The dispenser **MUST** be placed in a horizontal position.

B. COUNTER MOUNTING

The ice dispenser must be sealed to the counter. The template drawing (see Figure 6) indicates where openings can be cut in the counter. Locate the desired position for the dispenser, then mark the outline dimensions on the counter using the template drawings. Cut openings in the counter.

Apply a continuous bead of *NSF International*(NSF) silastic sealant (Dow 732 or equal) approximately 1/4-inch inside of the unit outline dimensions and around all openings. Then, position the unit on the counter within the outline dimensions. All excess sealant must be wiped away immediately.

2. The beverage tubes, drain tube and power cord are routed through the large opening in the bottom of the unit. See the MOUNTING TEMPLATE (Figure 6) for locating the required clearance opening in the counter for these utility lines.
3. DRIP TRAY DRAIN ASSEMBLY (see Figure 3): Route the drain tube to an open drain with the end of the tube above the “flood” level of the drain. Use the tubing, fittings, clamps, and insulation provided with the Dispenser to assemble the drain. The completed drain line *must* pitch continuously downward and contain no “traps” or improper drainage will result.

NOTE: Cornelius Inc. recommends that a water shutoff valve and water filter be installed in the plain water inlet supply line. A Cornelius Water Filter (P/N 313860000) and QUICK DISCONNECT SET (P/N 313867000) are recommended.

CAUTION:

Check the minimum flow rate and the maximum pressure of the plain water inlet supply line. **MINIMUM FLOW RATE MUST BE AT LEAST 125-GALLONS PER HOUR.** If flow rate is less than 125-gallons per hour, starving off the carbonator water pump will occur. Starving will allow the carbonator water pump to overheat causing the safety thermostat on the pump outlet to stop the water pump motor. Overheating could occur if the plain water supply line flow rate drops below 125-gallons per hour. **INCOMING PLAIN WATER INLET SUPPLY LINE WATER TO PUMP PRESSURE MUST REMAIN A MINIMUM OF 10 psi BELOW THE CARBONATED CO₂ OPERATING PRESSURE.** (Example: Carbonator CO₂ operating pressure is 75 psi and the maximum water pressure can be no more than 65 psi, etc.). Water over pressure (higher CO₂ operating pressure) can cause carbonator flooding, malfunction, and leakage through the carbonator relief valve. If water is exceeding maximum pressure specifications, a Water Pressure Regulator Kit must be installed in the plain water inlet supply line. If fitting connector is not available, tap into the plain water supply line with a 3/8 flare saddle valve.

4. Locate the carbonator pump assembly and connect to power cord from the Ice/Drink Unit to the pump. The cord is connected to the unit’s electrical box and has an electrical connector on the end that plugs into a receptacle in the junction box at the carbonator pump assembly. Connect inlet water to pump and pump outlet to Ice/

Drink Unit using 3/8-inch food-grade tubing. Disable the pump from operating by switching the switch in the carbonator pump assembly junction box to the OFF position.

5. Connect the beverage system product tubes as indicated in applicable Flow Diagram, Figure 8. This work should be done by a qualified service person.
6. Clean the hopper interior (see CLEANING INSTRUCTIONS in Owner's Manual).
7. Connect the unit power cord to a 120 volt, 60 cycle, 3-wire grounded receptacle. For 220-240 Volt International Units, a 3-wire power cord is provided. An adapter plug for the particular country will need to be provided by the Installer.

NOTE: See applicable Flow Diagram (See Figure 8) or Decal on the lower front of the unit for the location of syrup and water connections.

 **CAUTION:**

The following cautions apply for units containing the lower ADA compliant keypads.

1. The splash panel can not be removed from the unit without disconnecting the valve harness.
2. To remove the valve harness, the connector must be pulled straight up from the header. Damage may result if the header is extracted at an angle.
3. Care must be taken during installation of splash so that the harness are not pinched or damaged.

ADJUST CARBONATOR CO₂ REGULATOR AND TURN WATER INLET SUPPLY LINE ON

 **CAUTION:**

Before connecting the CO₂ regulator assembly to a CO₂ cylinder, turn the regulator adjusting screw to the left (counterclockwise) until all tension is relieved from the adjusting screw spring.

1. Open (counterclockwise) CO₂ cylinder valve slightly to allow lines to slowly fill with gas, then open the valve fully to back-seat the valve. (Back-seating the valve prevents leakage around the valve shaft).
2. The carbonator CO₂ regulator is fixed at a nominal 75 psi.
3. Open one of the post-mix dispensing valves to exhaust trapped air inside the carbonator tank.
4. Open the water inlet supply line shutoff valve.

UNIT OPERATION

 **WARNING:**

This unit must be grounded to avoid possible electrical shock to the operator. The unit power cord is equipped with a three pronged plug. If a three pronged (grounded) outlet is not available use an appropriate method to ground the unit.

Failure to comply could result in serious injury, death or damage to the equipment.

 **CAUTION:**

Never operate the carbonator pump with the water inlet supply line shutoff valve closed. "Dry running" the water pump will burn out the pump. A pump damaged in this manner is not covered by warranty.

5. Connect electrical power to the Unit.
6. Locate the switch on the junction box of the carbonator pump, and turn it ON. The water pump will start and fill the carbonator tank with carbonated water. The water pump will stop when the carbonator tank is full.
7. Check for water and CO₂ leaks, and tighten any loose connections
8. Dispense several drinks until the carbonator pump cycles on. The refill time should be about 5-7 seconds.
9. If the carbonator pump appears to be short-cycling, meaning a refill time of 1-2 seconds, refer to the Troubleshooting section.

GATE RESTRICTOR PLATE AND ADJUSTMENT

The rate at which ice is dispensed can be adjusted by varying the opening of the gate restrictor plate as illustrated in Figure 1. Reducing the dispense rate of ice is especially desirable when using glasses or other containers with small openings. To adjust the gate restrictor plate, loosen the (4) nuts that hold the ice chute assembly to the bin. The restrictor plate can now be moved up or down. When the restrictor plate is fully up, the ice gate opening is 2-1/2" in height, and the maximum rate of ice dispense is available (approximately 3 oz/sec). Retighten the (4) nuts to set the desired restrictor plate opening. **DO NOT EXCEED 40 IN-LB of torque.**

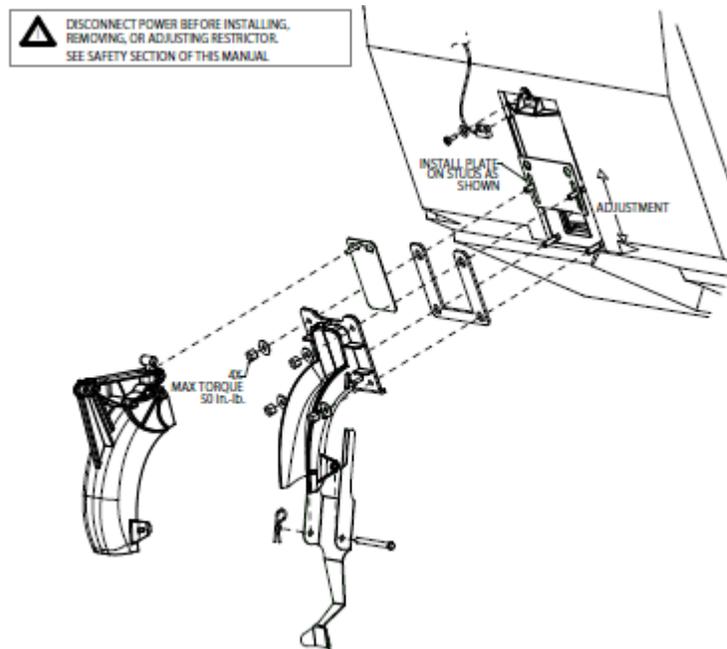

Figure 1. Gate Restrictor Plate

NOTE: Tighten (4) nuts for fastening lower ice chute in place to 50 in-lbs (max). Draw all four nuts tight uniformly.

PROGRAMMING MODES

There are two programming modes for the Cold Fusion keypads. The **Water Select Mode** is used to set each brand button to either carbonated or still water dispense. The **Brixing Mode** is used to set water flow rate and brix the valves.

The program modes are indicated by the intensity and flashing of the illuminated brand buttons. In the program modes, the brand buttons illuminate or flash at full intensity. In normal operation, the brand buttons illuminate at half intensity until pressed, they illuminate at full intensity as long as the brand button is held down.

Water Select Mode

All brand buttons are factory set for carbonated water dispense (Dispense Type 1). The water dispense type for each brand button can be changed using the Water Select Mode.

Water Select Mode Flashing Sequences

In Water Select Mode, each of the brand buttons flashes in a sequence according to one (1) of six (6) dispense types. Cold Fusion only uses Dispense Types 1 and 2. Dispense Types 3 through 6 are not used. However, it is possible to still program these Dispense Types. Insure that each brand button is only set to either Dispense Type 1 or 2 for normal dispensing. The dispense types are described below, and their corresponding brand button illumination sequence is shown in the timing diagram in Figure 2.

Dispense Type	Description	Button Illumination
Type 1	Carbonated Water Dispense	Solid
Type 2	Still Water Dispense	Flashing, 1.5 Sec. ON, 1.5 Sec. OFF
Type 3	Do Not Use	N/A
Type 4	Do Not Use	N/A
Type 5	Do Not Use	N/A
Type 6	Do Not Use	N/A

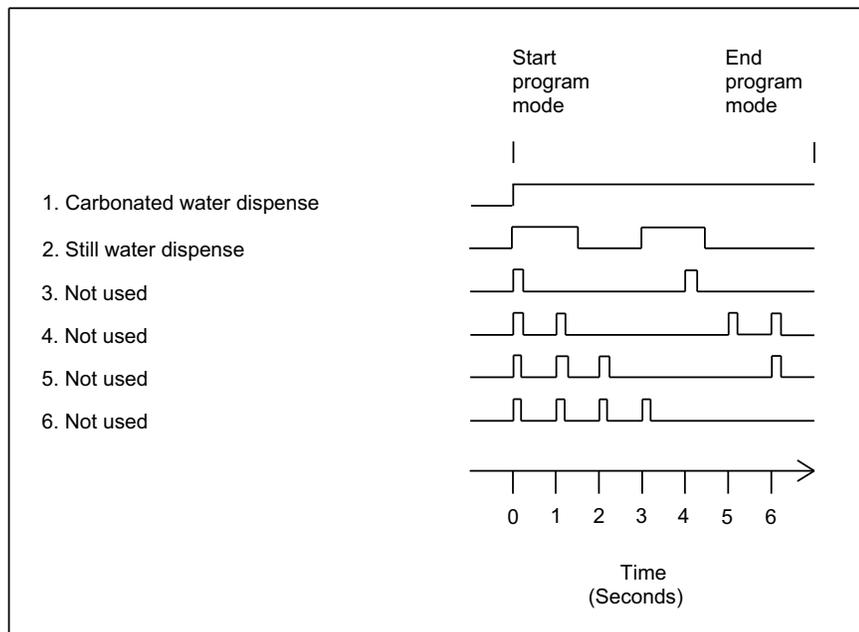

Figure 2. Water Select Mode Flash Sequence Diagram

Setting Water Dispense Type

To enter Water Select Mode from normal dispense mode, press and hold the two program buttons (see) at the top of the keypad for approximately 4 sec. All four of the brand buttons flash off for 1 sec. and then illuminate or flash at full intensity depending on the Dispense Type programmed.

To change a brand button from carbonated water to still water dispense, press the brand button once. The brand button should now be flashing at 1.5 sec. intervals.

To change a brand button from still water to carbonated water dispense, press the brand button 5 times to bypass Types 3 through 6. The brand button should now be illuminated.

To resume normal dispense, exit Water Select Mode. Press and hold the two program buttons for approximately 4 seconds. All four of the brand buttons flash off for 1 second and then illuminate at half intensity, indicating normal operating mode.

Setting Water Flow Rate

Setting the water flow rate will require a timed dispense. To accomplish this, the following procedure should be followed:

1. Enter Water Select Mode (press and hold the two program buttons (see Figure 4) at the top of the keypad for approximately 4 sec). All four of the brand buttons flash off for 1 sec. and then illuminate or flash at full intensity according to the Dispense Type.
2. Enter Brixing Mode from Water Select Mode by simultaneously pressing and holding Flavor 1 (Top Left) and Flavor 4 (Bottom Right) brand buttons until all four buttons flash rapidly.
3. Place an empty ratio cup under the appropriate nozzle and press the left program button to dispense 4 sec. of carbonated water. The target is 10 ounces to be dispensed. If necessary, adjust the water valve flow control (see Figure 3), empty ratio cup, and repeat until 10 ounces is dispensed.
4. Empty the ratio cup and repeat the procedure in step 3 pressing the right program button this time to dispense 4 sec. of still water. Again adjust the water valve flow control and repeat until 10 ounces is dispensed.
5. Exit Brixing Mode by simultaneously pressing and holding Flavor 1 (Top Left) and Flavor 4 (Bottom Right) brand buttons until all four of the brand buttons stop flashing rapidly. The brand buttons then illuminate or flash according to the Dispense Type that the brand button is programmed.
6. Exit Water Type Selection Mode by simultaneously pressing and holding both programming buttons for 4 seconds.

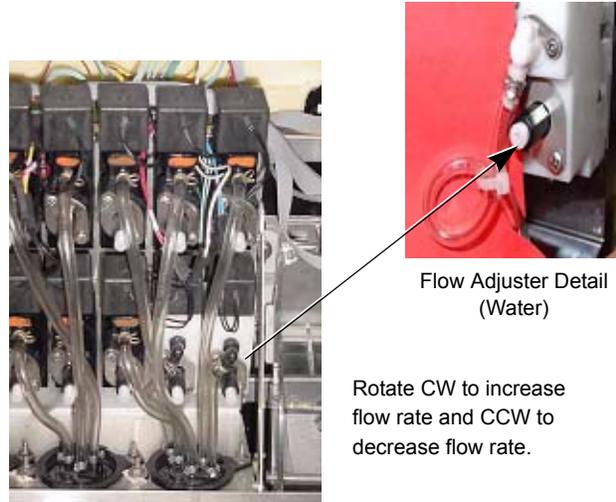

Figure 3. Valve with Flow Adjusters
(see plumbing diagram for plumbing and valve configuration)

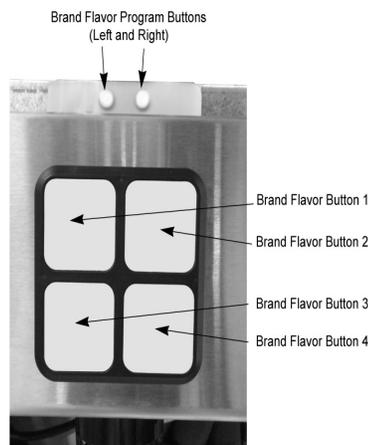

Figure 4.

Brixing Mode

The Brixing Mode is accessed from the Water Select Mode. To enter Brixing Mode, it is first necessary to enter Water Select Mode. Brixing Mode cannot be entered directly from normal dispense mode.

Brixing Mode cannot be exited directly to normal dispense mode. To return to normal dispense mode, it is first necessary to exit Brixing Mode then exit Water Select Mode. See flow chart in Figure 5..

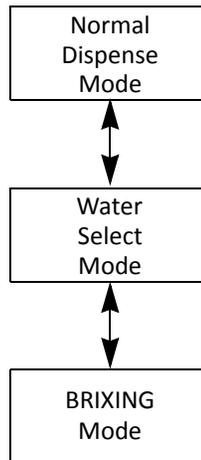

Figure 5.

Adjusting Syrup/Water Ratio (Brix)

Timed Dispense Procedure

1. Enter Water Select Mode (press and hold the two program buttons (see) at the top of the keypad for approximately 4 sec). All four of the brand buttons flash off for 1 sec. and then illuminate or flash at full intensity according to the Dispense Type programmed.
2. Enter Brixing Mode by simultaneously pressing and holding Flavor 1 and Flavor 4 buttons until all four of the brand buttons flash simultaneously.
3. Place the water end of the ratio cup under the appropriate nozzle and press the left program button for a 4 second dispense of carbonated water. (Push the right program button for still water pour.) If not 10 ounces, see Setting Water Flow Rate.
4. Place the syrup end of the ratio cup under the nozzle and press the desired flavor button for a 4 second dispense of syrup. The fill lines should be level for water and syrup. Adjust the syrup flow control if necessary, empty ratio cup and repeat steps 3 and 4.
5. Repeat for all syrups in the valve bank.
6. Exit Brixing Mode by simultaneously pressing and holding Flavor 1 (Top Left) and Flavor 4 (Bottom Right) brand buttons until all four of the brand buttons stop flashing rapidly. The brand buttons then illuminate or flash according to the Dispense Type that the brand button is programmed for.
7. Exit Water Type Selection Mode by simultaneously pressing and holding both programming buttons for 4 seconds.

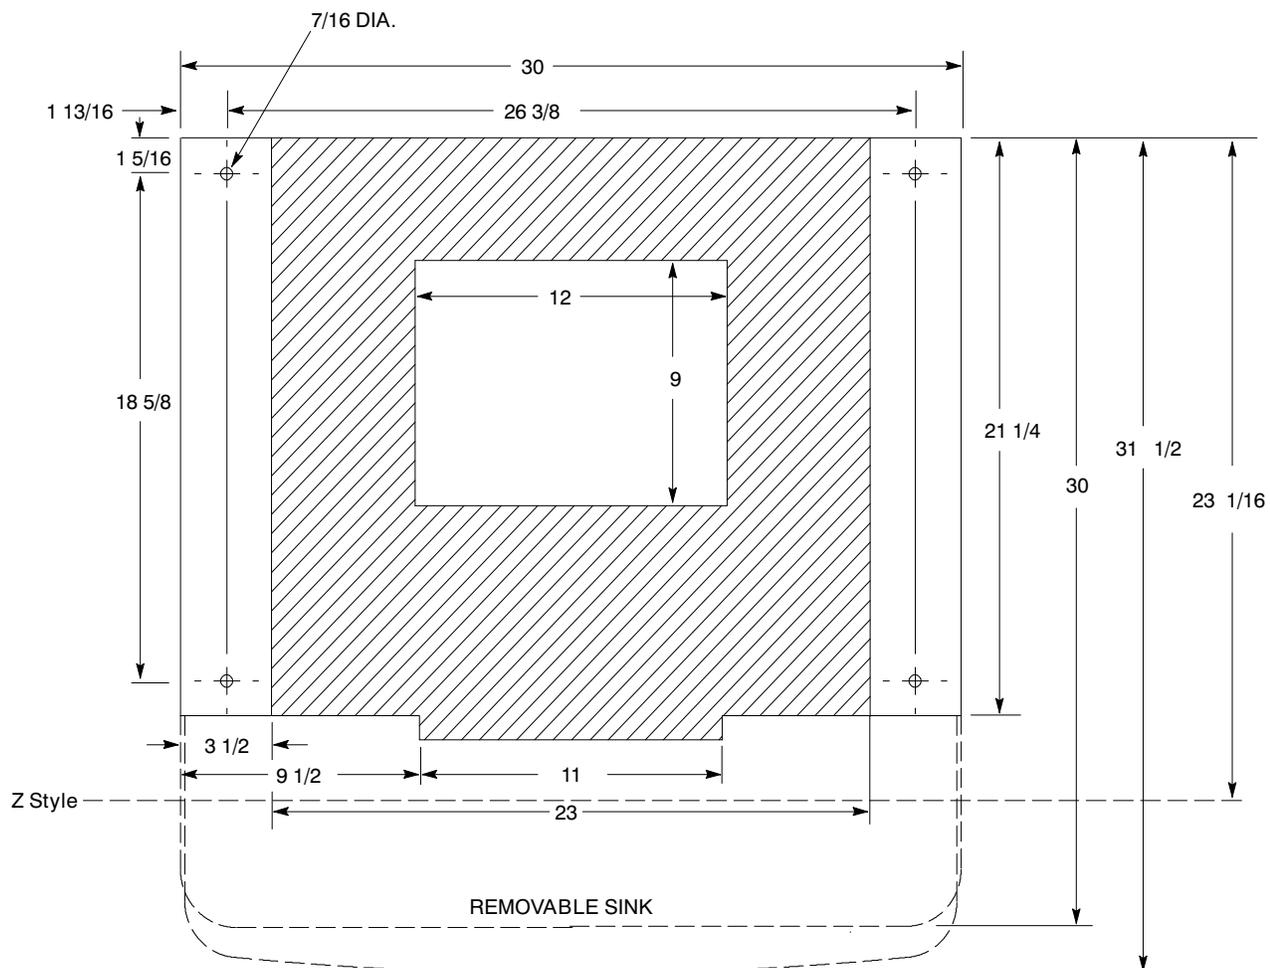

Setting a Button to Dispense Non-carbonated Water Only

1. Program the designated brand button to dispense non-carbonated water (See Water Select Mode).
2. Do not connect a syrup source to the inlet circuit of the designated button (1-14 or A1-A2). If circuit 1 through 14, is chosen leave the coldplate inlet circuit plugged with red cap. If circuit A1 or A2 is chosen, plug the end of the inlet tube, preferably with a barbed stainless steel plug and oetiker clamp.

Setting a Button to Dispense Carbonated Water Only

1. Program the designated brand button to dispense carbonated water (See Water Type Selection Mode).
2. Do not connect a syrup source to the inlet circuit of the designated button (1-14 or A1-A2). If circuit 1 through 14 is chosen, leave the coldplate inlet circuit plugged with the red cap. If circuit A1 or A2 is chosen, plug the end of the inlet tube, preferably with a barbed stainless steel plug and oetiker clamp.

NOTE: The ambient circuits A1 and A2 do not give up a cold plate circuit.

RECOMMENDED COUNTER OPENING SIZE
9 X 12 FOR UTILITIES AND BEVERAGE
TUBING. OPENING CAN BE LOCATED
ANYWHERE WITHIN SHADED AREA.

Figure 6. IDC 2XX Mounting Template

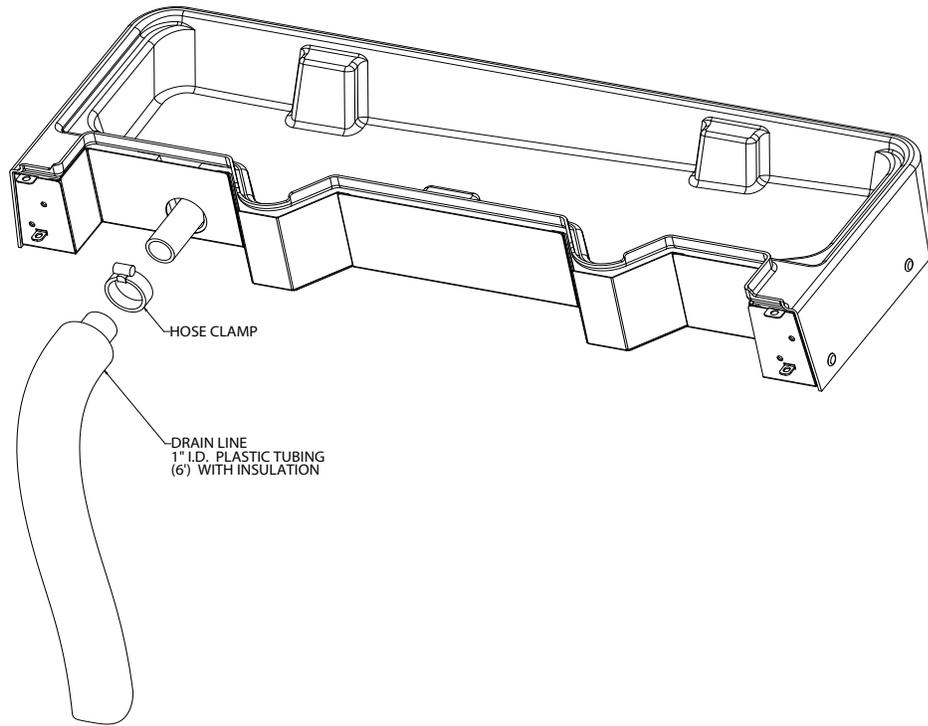

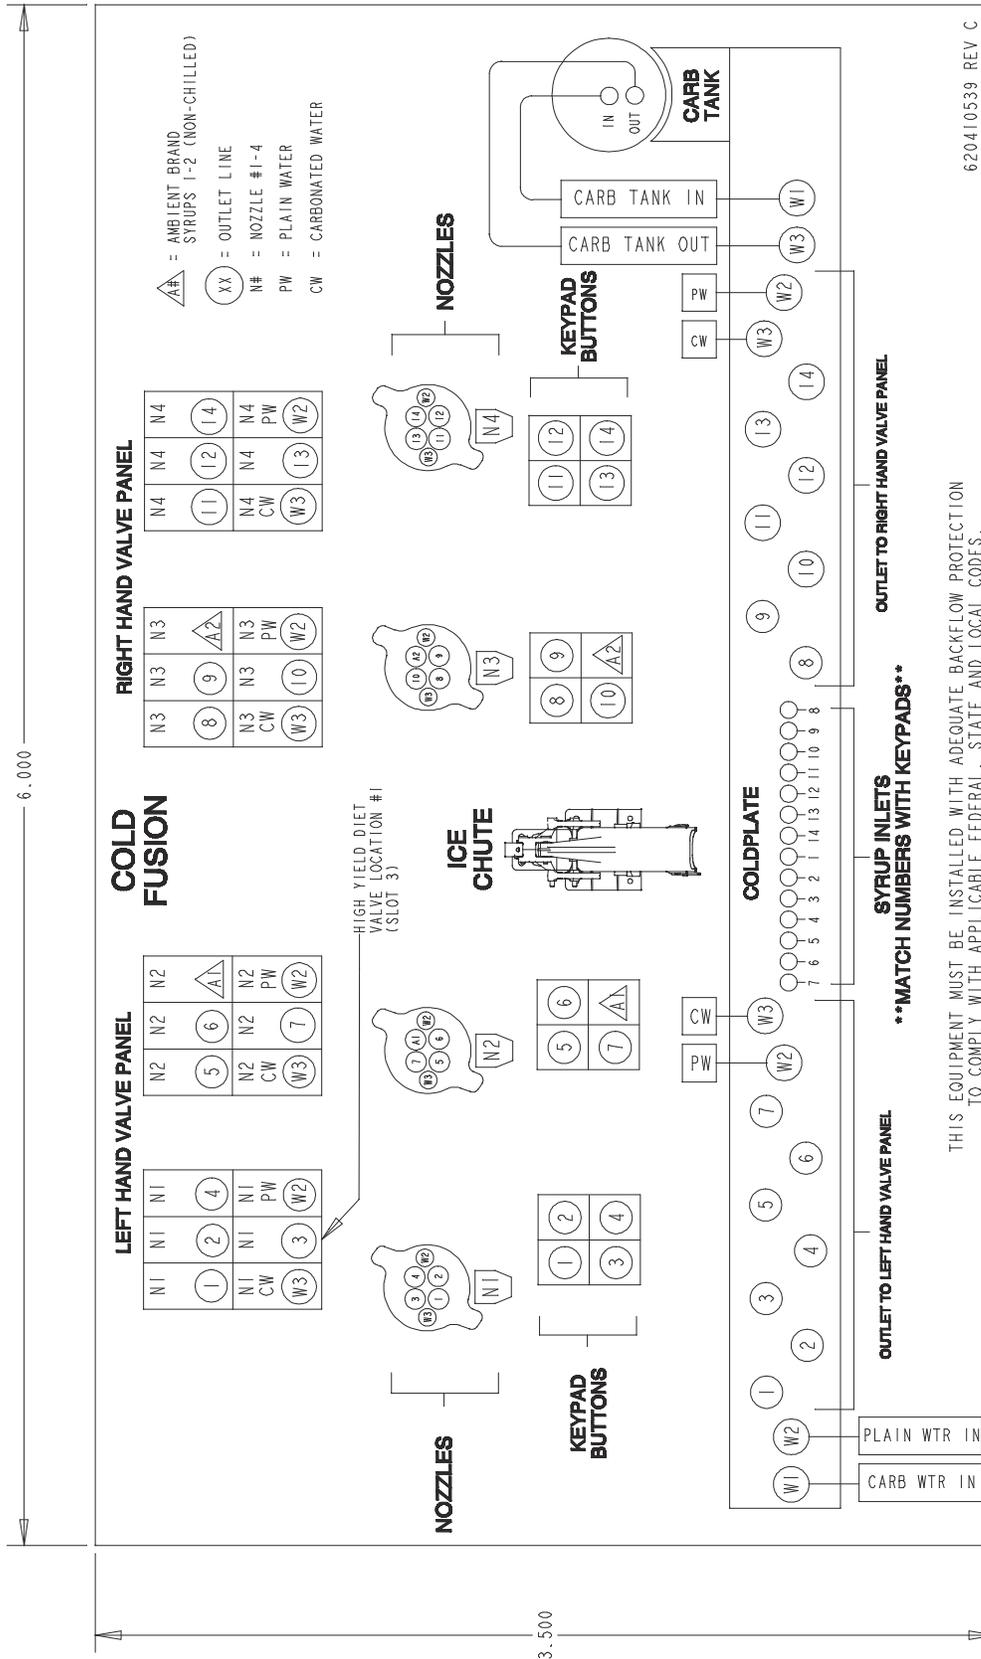

Figure 7. Drip Tray Drain Assembly

620410539 REV C

THIS EQUIPMENT MUST BE INSTALLED WITH ADEQUATE BACKFLOW PROTECTION TO COMPLY WITH APPLICABLE FEDERAL, STATE AND LOCAL CODES.

Figure 8. Flow Diagram

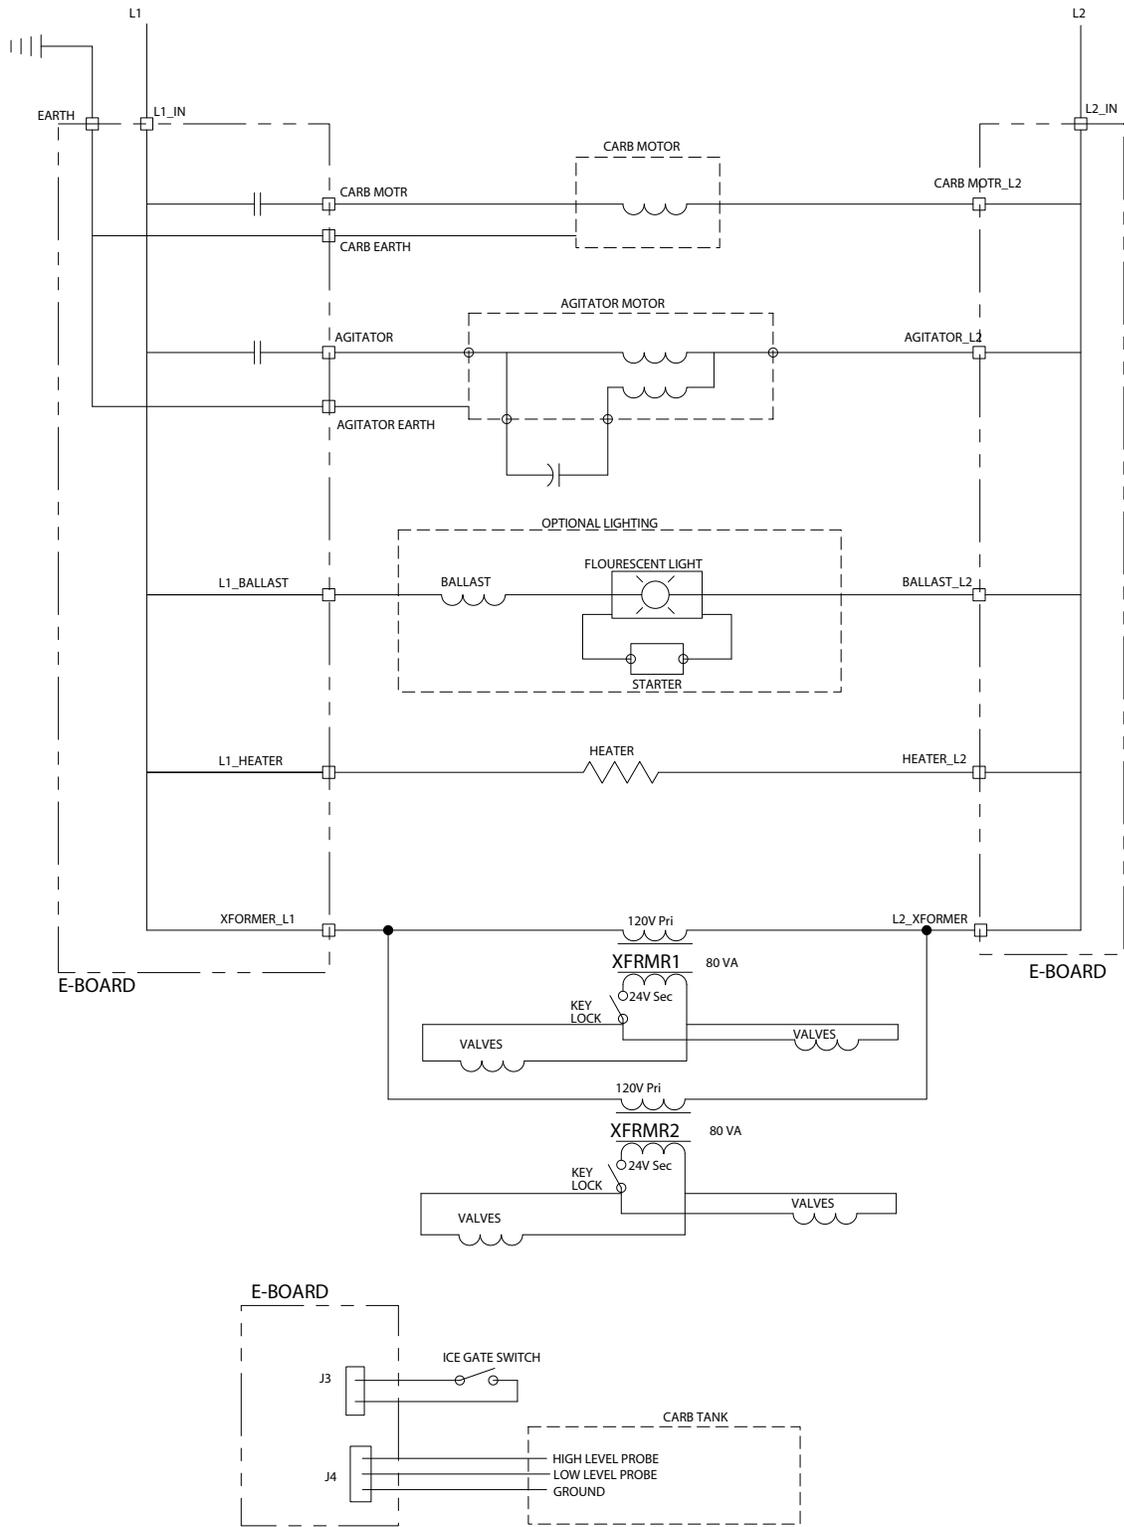

Figure 10. Wiring Schematic

TROUBLESHOOTING

IMPORTANT: Only qualified personnel should service internal components or electrical wiring.

WARNING:

If repairs are to be made to a product system, remove quick disconnects from the applicable product tank, then relieve the system pressure before proceeding. If repairs are to be made to the CO₂ system, stop dispensing, shut off the CO₂ supply, then relieve the system pressure before proceeding. If repairs are to be made to the refrigeration system, make sure electrical power is disconnected from the unit.

Should your unit fail to operate properly, check that there is power to the unit and that the hopper contains ice. If the unit does not dispense, check the following chart under the appropriate symptoms to aid in locating the defect.

Dispenser Troubleshooting		
Symptom	Cause	Remedy
Blown fuse or circuit breaker	Short circuit in electrical wiring	Repair Wiring
	Inoperable agitator motor (shorted motor)	Replace gear motor
Agitator does not turn	No power	Restore power or plug in unit
	Improperly installed upper ice chute assembly (Reed switch is not being activated)	Check the upper ice chute assembly for proper assembly and operation
	Inoperable reed switch	Replace reed switch
	Electrical board driver circuit is defective	Replace main control board
	Gear motor has open circuit	Replace gear motor
	Reed switch is not activated Improper assembly of upper ice chute to lower chute.	Check to make sure tongue of upper chute engages into the back of the lower chute, ensure upper chute engages outside the lower chute, and snap front of chute into place.
	Broken wire in the 2-wire harness leading to the reed switch	Repair or replace 2-wire harness
	Bad connection at main control board, J3, pins 2 & 3	Repair connection or replace 2-wire harness
Ice dispenses continuously	Ice gate mechanism is stuck in open position	Inspect gasket for proper position. Examine gate plate to see if it slides freely behind the lower ice chute.
	Stuck or bent ice lever (does not allow gate to close and open reed switch)	Examine ice dispense lever to see if it is bent.
Slushy ice or water in hopper	Blocked drains in cold plate	Remove access covers in cold plate cover & inspect/clean drains
	Poor ice quality due to water quality or ice maker problems	Correct water quality or repair ice maker
Beverage does not dispense	No 24VAC to valves	Restore 24 VAC to valves
	No CO ₂ pressure	Restore CO ₂ pressure

Beverage is too sweet	Valve brix requires adjustment	Adjust valve brix
	Carbonator is not operating	Repair carbonator
	No CO ₂ in carbonator	Restore CO ₂ pressure in carbonator
	City water pressure supply low or inconsistent	Booster pump must be used if dynamic water pressure drops below 40 psig.
Unit will not dispense carbonated drinks. Dispenses syrup only.	CO ₂ pressure in carbonator tank is too high.	Check CO ₂ pressure regulator setting. 75 psig recommended. Relieve pressure from carbonator tank.
	Water valve will not open	Check electrical connection to water valve. Check resistance of coil (should be 9 ohms). Check for voltage at coil when brand button is depressed.
Unit will not dispense carbonated drinks. Spurts CO ₂ and syrup only.	Carbonator tank is empty, because tank was emptied while power was applied to unit. 5 minute time-out of carbonator pump/motor occurred, and carbonator pump is locked off.	Unplug the unit and reconnect the unit. Main control board will reset, ice agitation will occur, and carbonator tank will refill to normal level.
	Note that this can occur while the water filter system is serviced or water supply is shutoff. If drinks are drawn from the dispenser while water pressure is shutoff, the carbonator pump starts and runs continuously, then shuts off on the 5 minute timeout.	1) low water pressure switch deactivates carbonator pump, 2) after 5 minutes reset and retry carbonator pump. If water supply is restored, the 5 minute timeout will not occur. Repeat reset a second time, but on a third time, then lockout carbonator pump, which will generate a service call.
Carbonated drinks are flat (low on carbonation)	CO ₂ is out	Replace CO ₂
	Carbonator tank is 100% filled because the city water pressure exceeds the carbonator tank CO ₂ pressure regulator setting.	CO ₂ setting for the carbonator tank is 75 psig, max water pressure is 60 psig. If necessary, install a water pressure regulating valve.
Low water pressure	Could be caused by excessively long runs (over 40 ft.) of 3/8" water supply line.	Increase line size to 1/2"
	Low water pressure	Add water pressure booster pump
	Plugged water filter.	Change water filter
	Water booster bladder has burst	Replace water booster tank/bladder
No Syrup or Watered down drink dispensed	Syrup supply is empty	Replace BIB
	BIB pump not working	Replace BIB pump
	No CO ₂ or compressed air supply to BIB pump, or not enough pressure	Check CO ₂ pressure regulator setting. 65 psig recommended. Replace CO ₂ tank or fix compressor.

Carbonator Troubleshooting		
Symptom	Cause	Remedy
Carbonator pump does not start to fill tank	Power cord for the carbonator pump motor is not connected.	Carbonator pump is powered off the main control board inside the electrical box of the unit. Check that the umbilical cord is connected from the unit to the pump motor terminal box.
Power cord is connected but carbonator pump does not run.	Carbonator pump motor is disabled.	Check the enable/disable switch on the carbonator pump terminal box and enable it, if necessary.
	Probes were dry, unit was powered up, water was not turned on, and carbonator did not fill.	This results in a 5 minute timeout. Unplugging the unit and plugging it in will reset the unit and start the carbonator pump.
	Water service was interrupted for more than 5 minutes.	Unplugging the unit and plugging it in will reset the unit and start the carbonator pump.
Carbonator pump is short cycling with every drink drawn	Lower liquid level probe reads “dry” while upper probe reads “wet”	Check color of leads going to probes. Black should go to bottom probe and white to top probe. Reverse if incorrect.
Carbonator tank overfills, overflows through relief valve, and pump shuts off after 5 minutes.	A. Poor electrical connections between carbonator tank and main control board	A. Check connections at carbonator tank and at connector J4 on the main control board.
	B. Broken wires between carbonator tank and main control board	B. Replace wire harness
	C. Defective liquid level probes	C. Replace both liquid level probes

DIAGNOSTICS GUIDE FOR THE MAIN CONTROL BOARD

State	Observed State of Red LED	Sensor Input	Control Response	Service Remedy
0	Flash rate 3 seconds	Both probes read "wet"	Standby mode. Pump = OFF	No service required
1	Flash rate 1/2 second	Pump is OFF and HIGH probe reads "dry" and LOW probe reads "wet"	Waiting for level to drop below LOW probe. Pump = OFF	No service required
2	Flash rate 1/2 second	Both HIGH and LOW probes read "dry"	Normal mode. Pump = ON	No service required
3	Flash rate 1/2 second	Entered when HIGH probe does not detect liquid, and LOW probe does detect liquid, and pump is ON	Normal mode. Pump = ON	No service required
4	Flash rate 1 second	Entered when HIGH probe reads "wet" and LOW probe reads "dry"	THIS IS AN ERROR CONDITION.	<ul style="list-style-type: none"> - Check electrical connections at the carbonator tank, and at connector J4 on the main control board - Black wire should be connected to the LOW probe and also to Pin 4 of Connector J4 - Reverse the connections if incorrect - Replace harness if necessary
5	ON continuously, but "flickers" every 3 seconds	Poor signal connection to the carbonator tank. May result in short cycling of the carbonator pump.	Able to continue to function but carbonator pump short-cycles. Pump will come on each time a drink is drawn. THIS SITUATION SHOULD BE CORRECTED.	<p>Check the harness connections of the red signal wire at both ends:</p> <ol style="list-style-type: none"> 1) at the carbonator ring terminal and 2) at Pin 5 of the J4 connector at the main control board
6	ON continuously	Entered when pump has run continuously for 5 minutes	THIS IS AN ERROR CONDITION.	Unplug the unit and plug it back in. This will reset the unit's main control board and restart the carbonator pump.

DIAGNOSTICS GUIDE FOR KEYPAD LIGHTING

Observations of LED Lighting on Customer Interface Keypad

	Symptom	Cause	Remedy
1	Keypad LED lighting is not working	A. Poor connection between interface board and keypad PCB	A. Turn the keyswitch to disconnect power at the interface boards. Check harness connections at each interface board.
		B. Keypad LED's are burnt out	B. Turn the keyswitch to disconnect power at the interface boards. Unplug the ribbon cable from one interface board and test it by plugging it into the neighboring interface board. If the keypad still doesn't light up replace the keypad PCB.
		C. Interface board is defective.	C. Turn the keyswitch to disconnect power at the interface boards. Unplug the ribbon cable from one interface board and test it by plugging it into the neighboring interface board. If the LED's light up the interface board is defective. Replace the interface board.
		D. Corrosion at connector between keypad and ribbon cable.	D. Replace keypad circuit board and ribbon cable.
		E. Main control board is defective.	E. Replace the main control board.

NOTE: Contact your local syrup or beverage equipment distributor for additional information and troubleshooting of beverage system.

Cornelius Inc.
