

Tests that heal themselves while your team sleeps.

The Continuous Quality Agent runs nightly against your deployed app: detecting gaps, generating tests, and healing failures automatically.

CONTINUOUS QUALITY AGENT

ClearPoint Strategy	reservamos	Postilize	STELLIC	counterpart
70% of failures resolved without an engineer	1.5M+ test runs in the fine-tuning data	Nightly runs against your live app	100+ coding agents integrated via /checksum	0 prompts needed to trigger a heal

THE PROBLEM

**AI ships code fast.
Verification can't keep up.**

Coding agents have changed the pace of shipping, but every PR still needs to be tested, validated, and trusted before it reaches production.

Almost two-thirds of engineering leaders say that AI-generated code requires more review time than human-written code, not less. The gap widens every sprint.

THE SOLUTION

Runs nightly. Heals automatically.

The Continuous Quality Agent works the full quality loop: it detects gaps in coverage, generates tests for specific flows, runs them against your live app, and heals what breaks.

Every test is standard Playwright code, committed directly to your repo as a PR. No proprietary format, no lock-in.

By the time your team logs on, the suite's already green.

For less than half the salary cost of an offshore developer, I have the impact of a full QA team. If I were trying to replace what Checksum is doing, it would take me at least six to ten people.

Ron Alexssen
Engineering Manager, Counterpart

HOW IT WORKS

Four capabilities. Zero manual triage.

Automated maintenance	Runs nightly against your deployed app. When a test breaks, Checksum detects it, heals it, and submits a PR.
Generates production-ready tests	Creates real Playwright code with page object models and architecture built in, fine-tuned on 1.5M+ test runs.
Detects what needs testing	Automatically identifies gaps in coverage based on your app's structure and code changes. Delivered as a PR you own.
Integrates with coding agents	Works directly with Cursor, Claude Code, and 100+ AI tools via /checksum slash commands, without leaving your editor.

WHY CHECKSUM

What other tools can't offer.

- ✓ **Autonomous, not a copilot.** Agents run in the background, wake up when there's a failure, and come back with results. No babysitting, no back-and-forth prompting.
- ✓ **Continuous maintenance at scale.** Suites see median failure rates of 2.7 per 100 runs versus 14.8 for manual maintenance.
- ✓ **Playwright suites, not exports.** Proper architecture with page object models and reusable functions, connected to the AI that continues to maintain it.
- ✓ **No vendor lock-in.** Every test is standard Playwright, committed as a PR to your repo. You own it completely, even if you leave.
- ✓ **Fine-tuned on 1.5M+ test runs.** Runs nightly against your live app, so failures are caught and healed before your team logs on.
- ✓ **Native coding agent integration.** Works directly with Cursor, Claude Code, and 100+ AI tools via /checksum slash commands.

GETTING STARTED

Real tests in your pipeline before you commit to anything.

Every new customer goes through a structured Proof of Value (POV) before signing. Checksum handles access, goal-setting, and technical setup. Your team will have a fully running test suite in its repo, with daily regression cycles, by the end of the POV.

Throughout, you have a dedicated solutions engineer on Slack. Every line of code is yours whether you move forward or not.
